

Editor's Comment:

Manuscript Ms_AJRN_89443 is still too far to be accepted for publication.

Despite the reviewers' recommendations, the paper needs to be rewritten in several sections:

1-Introduction: Description of signs and symptoms are unnecessary. Only describe the current epidemiology and particular regional aspects if necessary.

2-Split of Results and discussion items is mandatory. One crucial situation not well clarified is the prevalence of diabetes in the studied population.

3-Please fix the current tables. One of them includes the distribution of proteinuria according to age, and another one with the correlations informed as r with values from -1 to 1.

4-In Conclusions only include the most important findings of the study without redundant information previously described.
