PART 1: Review Comments

| | Reviewer's comment | Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here) |
|-------------------------------------|---|---|
| Compulsory REVISION comments | This clinical case report is a wake-up call that can show that many laboratories are not prepared for the identification of bacteria such as <i>Campylobacter fetus</i>. It is also a rare microorganism in human infections, so it may not be suspected by the treating physician. Another important point is that the patient undergoing cancer treatment must be immunosuppressed, so any exposure makes him vulnerable, and he had also suffered from a gastrointestinal infection that could be the source of the infection. Another point is that the patient was carrying a device that was not in use, which constitutes a risk in a patient with his characteristics. | |
| Minor REVISION comments | It is important that laboratories have the ability to identify a pathogenic microorganism or have the service of another larger laboratory equipped with the necessary resources | |
| Optional/General comments | | |

PART 2:

| | Reviewer's comment | Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here) |
|--|--|---|
| Are there ethical issues in this manuscript? | <i>(If yes, Kindly please write down the ethical issues here in details)</i> | |
