

Editor's Comment:

I'll send my observations about the paper entitled: Effect of Addition of soybean oil, coconut oil, and corn oil to commercial feed on the growth of red tilapia (*Oreochromis niloticus*).

I noted that most of the reviewer recommendations were not replied especially the following:

In Figure 1. Diagram of Red Tilapia Biomass. I recommend clarifying that they are 1, 2 ... 6

1. The author need to engage services of an English language reviewer to proof read the text before submission.

2. The author needs to re-write the introduction

3. Results should be presented in averages and the Table and Figures should be mentioned in the narrative.

4. Data in the table should be presented as averages

Additionally, experimental design is not clear, since authors do not mention the individual number by treatment, or the replicas numbers. Statistical analyses are mentioned in Methods but in results are not mentioned, then conclusions are not supported. Most of data (averages) are lack of deviation values (SD). Axis of figure 1 can be cut near to the presented values. Figure 3 is unnecessary.
