

**Editor's Comment:**

Some issues remain: I don't know what is "metalysis" as Thrombolytics. Please, clarify.

The reference 8 is not appropriate because the authors wrote: "Some studies have shown an increased risk with late therapy (>12 hours after symptom onset) but more recent evidence does not support this finding", but the reference is from 1996. This is not a recent evidence.[8]Becker RC, et al for the National Registry of Myocardial Infarction Participants. A composite view of cardiac rupture in the United States National Registry of Myocardial Infarction. J Am Coll Cardiol.1996; 27:1321–1326.

The paper is not ready.
