

Editor's Comment:

- The case series is well written with appropriate figures and easy to read and logically structured.
- Table with clinical signs of the four cases is suggested as reviewers mentioned and in each case you can write complete/incomplete or probable harada.
- The course of systemic steroids in each case should be mentioned in more details (dose-duration-tapering)
- Case 4 is considered probable harada

Minor revision with the previous recommendations may improve it.
