

**Editor's Comment:**

I had read the paper

It is ok for a very superficial morphological characterization

Yet the author claims that this is the first time the plant was recorded or detected in Odisha

I would like to see an evidence or proof that supports such claim

I also would like to see any interpretation of this new appearance in this region in order to have solid and convincing data

I dont like at all the quality of the pictures attached for the plant

Please ask the author to provide more information to support his MS.
