

### **Editor's Comment:**

I very much appreciated the wise reflections of the reviewers on the original research article: "Association Between Hemoglobin Levels and Dietary Iron Consumption Among Pregnant Women in Bangladesh: Cross sectional Study". Among the most relevant ones, some touched on important aspects that may help to improve the research. When comparing the revised version with the original manuscript, it did not seem to me to have any relevant changes. Thus the concerns raised by the reviewers, which are also mine, remain unresolved, namely:

- i) The ethical procedures dispensed to women with anaemia,
- ii) The scant statistical treatment of the variables under study,
- iii) The uninformative discussion;
- iv) The very personal conclusions.
- v) The non-authentication of the last paragraph of the introduction.

I hope in a short time that at least part of the changes requested by the reviewers will be taken into account, underlining in blue the changes introduced throughout the text.
