<b>Compulsory</b> REVISION comments	The article comprises interesting data concerning the impact of weed management practices (treatments using chemical herbicides, respectively, allelochemicals) on weed growth (five species), nutrient uptake and removal, respectively, on direct seeded rice nutrient uptake and grain yield. The Introduction presents the scientific background and the main objectives of the study and is well correlated with the scientific literature, the Material and Methods are well described, reproducible, the Results are logic, well represented in figures and tables and explained in the discussions. The results recommend the treatment with bispyribac sodium (post emergence) and bensulfuron methyl + pretilachlor (pre emergence) for achieving best results in the management of weed flora in the case of direct seeded rice.
