

Editor's Comment:

It seems the author did not consider the issues seriously. The revised manuscript is far from expectations. He did not even change the word "convectonal" to "conventional" in the abstract and the other parts are worthless to point out. He has basically avoided all of the critical issues and suggestions.

Please note that the bacterial strains need to grow first on the Mueller Hinton agar plates by maintaining the 0.5 McFarland standard. After that, CLSI (<https://clsi.org/meetings/susceptibility-testing-subcommittees/>) and EUCAST (<https://www.eucast.org/>) guidelines must be followed to determine whether the strains are resistant or susceptible or intermediate resistant.

Since the author was unable to make the necessary changes, the manuscript seems very problematic to me. Therefore, I am still refraining from recommending this manuscript to be published. In my opinion, this manuscript should not be considered further for publication in order to maintain the journal's quality.
