

Editor's Comment:

The article needs a deep revision in all items. Abstract should be reorganized (brief introduction, objectives, methods, results)

The Introduction is very poor, it needs a better and updated support . Plant material identifications by experts is not declared.

Table 2 or figure 1, are not needed to show only one result. Antimicrobial activity needs more results, not only mm of inhibition.

The article should be revised and written properly, the English version is not comprehensive. It can not be published.
