

**Editor's Comment:**

1. Author has been asked to standard family size so that, can be determined whether a family size is small, medium or large when compared to the standard family size but author did not mention about it.
2. Author was suggested to support his/her finding by evidence but did not include any references.
3. However, Correlation coefficient only measures the strength of the linear relationship between two variables and should not and cannot be used in determining the contribution of the individual variables to the dependent variable. Author was advised to use multiple linear regression model in this case, where the regression coefficients could be interpreted as the contributions of the individual variables depending on whether they are significant or not but did not do.
4. In conclusion, author must state about which Farming Enterprises of the Marginal Farmers contributed at what level (%) towards Household Food Security.
