

Editor's Comment:

The manuscript provides valuable information in regard to the topic of mosquito in the area Anyigba.

Authors should focus on some details that could improve their text and after that it could be considered for further publication. Moreover, they haven't followed the extensive comments of the second reviewer (Afr) especially in the section of Results-Discussion-Conclusion that I also agree.

-Genus name should be in italics in all text and tables

- In materials and methods authors should clarify how they managed to collect only adults' female mosquitoes

-Statistical analysis: a)Why the dataset was pooled together and not analyzed separately? Specify b) I recommend a statistical comparison between boxes in order to have a more elaborate results and discussion explaining the outcomes.

-Numbers in Tables corresponds to percentages? Clarify in table captures

- Tables 1-3 could be joint together. Table 4 is a summary of previous tables. In addition numbers should be checked as Anopheles is depicted with 72 in Table 4 block A, but in table 1 as 71.
