Design and Development of Ground collection system for Neem fruit

15
17

ABSTRACT

India is one of the leading producers of neem in the world. But still, there is no mechanical system available for either harvesting the neem fruits from the tree or collecting the neem fruits from the ground. Also, the manual ground collection of neem fruit is a very laborious and time-consuming operation. The cost of ground collection of neem fruit is higher than its selling price which makes neem plantation uneconomical. The introduction of a collection system for collecting the neem fruit from the ground may represent the technological change that is the key factor for improved competitiveness. The main purpose of this work was to develop ground collection system based on the principle of suction. The design of the machinery was based on a determination of fruit geometry and its physical and engineering properties. The proposed innovation enabled a fully mechanical solution for collecting the fallen neem fruit from the ground, achieving a collection capacity of approximately 10 kg.h⁻¹ with a collection efficiency of over 90%.

1. INTRODUCTION

22 Neem (*Azadirachta indica*), the “wonder tree”, belonging to the meliaceae family is one of
23 the most suitable, valuable and versatile tree species found in the Indian sub-continent ^[1,4].
24 India is one of the leading producers of Neem in the world by producing 4.4 lakh tonnes of
25 Neem yielding 88,440 tonnes of oil and 3.5 lakh tonnes of cake annually and globally ^[3]. In

26 India, it occurs throughout the larger parts of the country and majorly in the states of Uttar
27 Pradesh, Bihar, West Bengal, Orissa, Delhi, Maharashtra, Gujarat, Andhra Pradesh and
28 Tamil Nadu ^[2]. Generally, Neem trees are often found growing scattered in the farmers'
29 fields and on the boundaries of fields without affecting the crops. Farmers practice this
30 system just to meet the local demand for timber, fodder, fuelwood and also for various
31 medicinal properties. Due to its deep tap root system, it does not compete with other annual
32 crops.

33 The flowering season of neem varies from place to place. Generally, it flowers from January
34 to May and the ripening time of fruits is from May to August ^[18]. Neem starts bearing fruits
35 after 5 years and comes to full bearing at the age of 10-12 years.^[7] In the initial years, fruit
36 yield is 5-20 kg per tree per year. A mature tree produces 35-50 kg of fruit per year.^[18] Oil
37 yield varies from 40-43% of seed on dry weight basis ^[5]. It has been estimated that India's
38 Neem bear about 3.5 million tonnes of kernels every year. From this, about 7 lakh tonnes of
39 oil might be recovered ^[7].

40 In recent years, various alternative attempts have been made to mechanize the harvest of
41 neem fruit, but no satisfactory results had been obtained. Recently, olive fruit combing
42 devices have been tried by a few farmers for the harvesting of neem fruit but the main
43 disadvantage brought up was that they also pluck out the leaves with the fruit which in turn
44 requires additional operation and human for the separation of neem leaves from the fruit.

45 At present, there is no mechanical system available for either harvesting the neem fruits
46 from the tree or collecting the neem fruits from the ground. The ripened fruits fall on the
47 ground on their own and are collected manually by the women laborers ^[6]. But, the manual
48 ground collection of neem fruit is laborious and time-consuming operation ^[4]. A women
49 labour can collect up to 10-15 kg per day at the labour wages of ₹250 per day. The cost of
50 operation for the collection of neem fruit from the ground is ₹30 per kg whereas the selling
51 price of the neem fruits is only ₹25 per kg which makes it uneconomical and a loss for the
52 growers ^[7].

53 Thus, the cost of collecting the neem fruits from the ground is very high and it makes the
54 future of neem plantations uneconomical, whose conversion to other more modern layouts is
55 not always possible due to several limitations. The introduction of a collection system for
56 collecting the neem fruit from the ground may represent the technological change that is the
57 key factor for improved competitiveness.

58 **2. MATERIAL AND METHODS**

59 **2.1. Conceptual Framework**

60 The conventional method of harvesting neem is still widely practiced by most of the farmers.
61 The practice includes hand picking of the fallen fruits, cleaning and finally bagging. All of the
62 aforementioned tasks are accomplished manually, which takes too much time and energy. In
63 order to replace manual bagging and collection of neem from the ground, this study was
64 carried out by looking at existing designs of different pneumatically operated machines from
65 developed, emerging, and developing countries. Based on the findings, it was decided to
66 adopt, adapt, and simplify the good characteristics of the existing designs in order to create
67 the prototype machine. Design criteria that satisfy the local environment were identified
68 based on the accessibility of machine parts and components in the local market. A
69 conceptual drawing was created based on the design specifications and design data. The
70 functional requirement of conceptual frame work is furnished in Table 1.

72 2.2. Properties of Neem fruit

73 The physical and aerodynamic properties of Neem fruit that influences the development of
74 ground collection system for Neem fruits has been studied.

75 2.2.1. Physical Property

76 Some physical properties required for the designing of the prototype had been determined
77 and referred from the previous studies, which encompass size, weight of a hundred neem
78 fruit (Fig. 1), bulk density and moisture content of the neem fruit^[4]

79
80

Fig. 1: Weighing of 100 neem seed using digital weighing balance.

81 2.2.2. Aerodynamic Property

82 The terminal velocity was determined by an air column made up of a vertical wind tunnel of
83 diameter 44.48 mm and a height of 600 mm (Fig 2(a)). A digital anemometer (Make:Lutron
84 Model:AM-4201) was used to determine the air speed (Fig 2(b)). A sample of the neem fruit
85 was dropped into the air stream from the top of the air column and the air velocity was
86 adjusted until the neem fruit came into a suspended state in the air stream^[17]. The
87 respective velocity (m.s^{-1}) near the location of the fruit suspension was measured with the
88 help of the digital anemometer having an accuracy of $\pm 0.1\text{m.s}^{-1}$. Measurement of the air
89 velocity was replicated ten times^[17].

91

92 **2.3. Design of Major Components**

93 Based on the findings of numerous studies and from the assessment of various
 94 commercially available pneumatic leaf and trash collectors, design requirements for the
 95 machine were synthesized. Some of the highlighted design requirements were: 1) the
 96 machine should efficiently collect neem fruits on levelled as well as undulated fields; 2)
 97 the machine should eliminate stones and leaves of the forage materials during suction of the
 98 neem fruit; 3) the machine should reduce drudgery and speed up collection; and 4) the
 99 machine should be of intermediate technology, made from local materials using local
 100 manufacturing technology, simple and safe to operate and maintain, functionally and
 101 structurally sound, and with minimal tooling^[7]. The machine majorly consists of a trolley,
 102 prime mower, suction chamber with impeller, suction hose, storage bin, etc. The details of
 103 the design requirements of the components are as follows:

104 **2.3.1. Engine**

105 The calculation of the power requirement by the machine for the suction of neem fruit was
 106 based on the pressure and velocity of airflow^[9].

107 Power consumption,

108
$$(KW) = \rho_{air} \cdot Q_{air} \cdot H_{air} \times 0.746/75 \tag{1}$$

109 Where,

110 ρ_{air} = density of air, 1.293 kg.m⁻³

111 Q_{air} = air flow rate, m³.sec⁻¹

112 H_{air} = pressure head, m

113 Power consumption = 1.293 x 0.0729 x 837.46 x 0.746/75
 114 = **0.8 KW**

115 Since then, according to the requirements and market availability, 0.82 KW engine has been
 116 selected.

117 **2.3.2. Impeller**

118 The type of impeller selected for the study was a forward curved type as the pressure head
 119 generated by this type of impeller was found to be greater than the backward curve and

120 radial type impellers.^[11] The diameter of the impeller was 168 mm. It had been encased
 121 within the 180 mm housing all along. The selection of impeller design was based on the
 122 operation it had to perform and for the required suction purpose, backward curved impellers
 123 suit best.^[10] The top view and isometric view of impeller are shown in Fig. 3(a) and 3(b).

124
 125 Fig. 3(a): Top view of impeller

Fig. 3(b): Isometric view of impeller

126 **2.3.3. Suction Hose**

127 A flexible Poly vinyl chloride material hose pipe of 80 mm in diameter has been selected for
 128 the machine. The pipe is having spiral reinforcement of copper wire, which provides strength
 129 and also aids it to sustain its shape during the action of suction pressure inside the pipe. It is
 130 tightened at both ends with the help of a GI clamp.

131 **2.3.4. Suction Nozzle**

132 The design of the suction nozzle assembly was based on the Walinga design. The following
 133 design data were required: 1) the thickness of the fruit when spread on the ground, 2-3 cm
 134 ^[4]; 2) the diameter of the suction pipe, 80mm; and 3) anthropometric data such as knuckle-
 135 to-elbow length, elbow height, and hand grip diameter. The overall length of the suction
 136 nozzle assembly was determined using equation (2) ^[11].

137
$$z = \frac{y+x\cos\beta}{\sin\theta} \quad (2)$$

138 Where: z = Overall length, mm
 139 y = Elbow height, mm
 140 x = Knuckle-to-elbow length, mm
 141 β = Angle made by arm from the vertical, 110°
 142 θ = Angle made by the handle with horizontal, 45°

143 **2.3.5. Storage bin**

144 A plastic storage bin is placed in the trolley below the duct. The placement of the bin is such
 145 that it catches all the neem falling out of the shutter when it gets open. The storage bin was
 146 designed based on the density and working capacity of the machine. The volume and
 147 storage capacity can be determined by using equation (3) and equation (4).

148 **Volume of Storage bin** = Volume of truncated square pyramid
 149
$$= (a^2 + ab + b^2) \frac{h}{3} \quad (3)$$

150 where, a = 330 mm
 151 b = 230 mm
 152 h = 400 mm

153 Therefore, Volume = $[330^2 + (330 \times 230) + 230^2] 400/3$
 154 = 31693333.33 mm^2
 155 = 0.0317m^3

156 The density of neem seed in an average is 360 kg.m^{-3} .^[4]

157 Therefore, the storage capacity of the bin can be estimated as:

158 **Storage capacity** = Volume of container x Density of Neem (4)
 159 = $0.0317 \text{ m}^3 \times 360 \text{ kg.m}^{-3}$
 160 = **11.412 kg ≈ 12 kg**

162 Hence, based on the design requirements and market availability, the storage bin of size 330
 163 x 330 x 400 mm with the volume of 12 kg was selected.

164 The final conceptual drawing of the prototype is shown in Fig 4.

165
 166

Fig, 4. Design layout of the machine prototype.

167 **2.4. Development of Prototype**

168 The developed prototype for the ground collection of neem fruit essentially consists of the
 169 following functional system:

170 **2.4.1. Power Transmission System**

171 A 0.82 hp air cooled, single cylinder, two-stroke petrol engine was used as the prime mover
 172 of the Neem collector. The engine is directly connected to the impeller via a shaft of 10 mm
 173 in diameter which rotates the impeller at a speed of 2800 rpm. The engine was mounted on
 174 the bed provided at the top of the trolley using 4 mm diameter x 25 mm bolt.

175 **2.4.2. Suction Unit**

176 A plastic forward curved type impeller with a casing was used in the suction blower of the
 177 machine. The 168mm diameter impeller consists of 14 blades, comprising 7 small and 7
 178 large blades cast at an angle of 30° from the centre. The blades were 37mm tall and rotated
 179 in a horizontal axis inside a 180 mm diameter casing. The suction orifice provided at the eye
 180 of the impeller was 110 mm diameter. Prior to the installation of the centrifugal impeller, a 10

181 mm diameter hole was drilled at the centre. Then, the impeller was tightened to the engine's
182 grooved shaft with a 5mm diameter nut and a washer.

183 **2.4.3. Conveyance System**

184 The conveyance system of the machine included a suction nozzle assembly, suction hose,
185 outlet shutter and diverter assembly.

186 **2.4.3.1. Suction Nozzle Assembly**

187 The suction nozzle is an important device in the vacuum conveying system. The suction
188 head was completely flat. A 16-gauge mild steel sheet was used in the fabrication of the
189 rectangular suction nozzle head. The suction nozzle assembly's downstream portion was
190 made of 80 mm diameter mild steel pipe. A sieve with 25.4 mm of square holes was placed
191 inside the nozzle for only allowing the neem fruit to pass and restricting the bigger size
192 particles to enter inside the hose. The assembly was fixed on the elongated bottom side of
193 the frame.

194 **2.4.3.2. Suction Hose**

195 An 80 mm diameter, 500 mm long copper wire reinforced flexible plastic hose was used as a
196 conveyance line from the suction nozzle assembly to the inlet of the diversion duct.

197 **2.4.3.3. Diversion Duct**

198 A 110 mm diameter, T-shape poly vinyl chloride duct with shutter mechanism at the
199 diversion exit, was used as the diversion unit. Inside the duct, a sieve of 10 mm square holes
200 at the impeller opening had been placed to retain the neem fruit and divert it towards the exit
201 end. On the other end, it consists of a reducer of 110/80 mm, through which the hose pipe is
202 attached. At the bottom exit of the collection duct, a lever-operated shutter mechanism has
203 been installed to let out the sucked neem into the storage bin.

204 **2.4.3.4. Outlet Shutter**

205 A lever-operated shutter mechanism made up of mild steel had been installed at the bottom
206 exit of the diversion duct for arresting the vacuum generated in the duct, during the suction
207 operation. Once the suction of the neem fruit below a neem tree gets completed, the shutter
208 can be opened by the operator by pressing the lever provided at the right push handle, for
209 letting out the sucked neem fruit. Once after releasing the lever, the shutter again
210 automatically shuts off the exit of the duct.

211 **2.4.4. Storage Section**

212 The storage section below the diversion duct supports a plastic box for bagging neem during
213 operation. It was fixed to the channel provided in the main frame. The dimensions of the
214 plastic containers were 330 x 330 x 400 mm.

215 **2.4.5. Supporting Frame**

216 The main frame was fabricated using 12 mm MS square pipe. A channel was also fabricated
217 using a 12 mm MS flat bar for arresting the plastic container. On the top of the frame, a seat
218 was provided for mounting the engine. In order to facilitate mobility, the overall structure was
219 outfitted with one swivel caster front wheel of 101 mm diameter, two solid rubber front
220 wheels of 127 mm diameter, and push handles made out of metal pipe with a 12mm
221 diameter.

222 **2.5. Cost Analysis**

223 A cost analysis was done to determine the financial and economic indicators of the ground
 224 collection machine for neem fruit. The annual cost equation (5) by Hunt ^[13] was used in
 225 performing the simple cost analysis.

$$226 \quad AC = FC + W(Vc)/C \quad (5)$$

227 where: AC = Annual cost, Rs.yr⁻¹
 228 FC = Fixed cost, Rs.yr⁻¹
 229 W = Total weight of Neem seed, kg.yr⁻¹
 230 Vc = Variable cost, Rs.h⁻¹
 231 C = Collecting capacity, kg.h⁻¹

232 3. RESULTS AND DISCUSSION

233 3.1. Properties of Neem Seed

234 The physical properties required for the design of the prototype have been studied and
 235 referred to in the existing studies. The trials for obtaining the terminal velocity of the neem
 236 fruit have been carried out in the laboratory setup available in the Department of Farm
 237 Machinery and Power Engineering, Agricultural Engineering College & Research Institute,
 238 Tamil Nadu Agricultural University, Coimbatore. The results obtained are tabulated in Table
 239 2.

240 **Table 2: Properties of Neem Seed**

S.No.	Properties	Value
1.	Size	
	1.1. Length	15 – 20 mm
	1.2. Geometric Mean Diameter	8 -12 mm
2.	Weight of 100 seeds	59 g
3.	Volume	4.55 - 4.57 mm ³
4.	Bulk Density	354.2 – 375.1 kg.m ⁻³
5.	Terminal Velocity	8.8 – 9.2 m.s ⁻¹

241 3.2. Description of Ground collection machine for Neem fruit

242 A simple mobile engine-driven pneumatically operated ground collection system for neem
 243 fruit, was designed and fabricated for the collecting of Neem fruit from the field. The mobile
 244 engine-driven pneumatic Neem collector had the following major components: power
 245 transmission system, suction unit, conveyance system, storage section and frame. Fig. 5(a)
 246 shows the ground collection machinery for Neem fruit and its operation in Fig. 5(b). The
 247 specifications of the developed prototype are presented in Table 3.

Fig. 5(a). Ground collection machinery for Neem fruit.

Fig. 5(b). Collection of neem fruit by the developed prototype

248

Table 3. Specification of the Ground collection machinery for Neem fruit

Components	Specifications
Overall Dimensions and weight	
Length x Width x Height	950 x 440 x 955 mm
Weight	20 kg
Suction Unit	
Type	Centrifugal
Overall Dimension	255 x 150 x 360 mm
Overall Weight	5.6 kg
Impeller :	
Type	Forward Curve
Dimension (Dia. x Width)	165 x 30 mm
Number of blades	14
Suction Side	
Shape	Circular
Diameter	120 mm
Material	Plastic
Suction Nozzle Assembly	
Type	Flat
Diameter of downstream side	80 mm
Dimension of pick-up side (L X W)	200 x 25 mm
Material	Mild Steel
Suction Line	
Type	Flexible hose
Size (Diameter x Length)	400 x 500 mm
Material	Vinyl Copper wire reinforced
Wheel	
Front:	
Type	Swivel caster wheel

	Size (diameter X width)	100 X 30 mm
	Material	Plastic
	Number	1
Rear:	Type	Solid Rubber wheel
	Size	200mm X 50mm
	Material	Rubber
	Number	2
Prime mover	Type (Stroke/Ignition)	2 stroke
	Rated power	0.82 hp
	Rated speed	2800 rpm
	Cooling system	Air cooled
	Starting system	Rope ranking
	Dry weight	5 kg

249 3.3. Simple Cost Analysis

250 A simple cost analysis was conducted to guide potential users of possible benefit projections
 251 in using ground collection machinery for neem fruit. The machine is assumed to be utilized
 252 for 400 h per annum at eight hours of operation per day. A single operator is required to
 253 operate the machine.

254 The total cost of the machine was ₹ 30,000.00. The fixed cost of collecting neem fruit using
 255 the machine annually was ₹ 10,640 while the variable cost was ₹ 51,169. The cost of
 256 collecting neem seed using the designed machine was ₹ 2.55.kg⁻¹ whereas the cost of neem
 257 fruit collection in conventional method was ₹30 kg⁻¹.

258 The break-even point was 127 kg.yr⁻¹. Utilizing the machine for 400 hours per year will
 259 generate an income of ₹10,980 yr⁻¹. The projected time needed to recover the cost of the
 260 machine based on 10 kg.h⁻¹ collecting capacity was 3.64 years.

261 4. CONCLUSION

262 This study was conducted to design, develop and evaluate the ground collection system for
 263 neem fruit. It attempted to mechanise the process of collecting neem fruit from the ground,
 264 and it addresses the issue to the greatest extent possible.

265 The ground collection machinery for neem fruit had the following major components: power
 266 transmission system, suction unit, conveyance system, storage section, and frame. The
 267 estimated collection capacity of the machine was calculated to be 10 kg.hr⁻¹. The results so
 268 far have been promising. Further improvements are advisable based on the extensive field
 269 trials.

270 The machine entailed an investment cost of ₹ 30,000; an annual generated income of Rs.
 271 10,980. yr⁻¹ at a collecting cost of ₹ 2.55 kg⁻¹. The payback period of the machine was
 272 estimated at 3.64 years.
