

Original Research Article

Effect of foliar application of iron (Fe) and zinc (Zn) on growth, yield and quality of strawberry (*Fragaria ananassa*) cv. winter dawn.

ABSTRACT

An experiment on the “Effect of foliar application of Iron (Fe) and zinc (Zn) on growth, yield and quality of strawberry (*Fragaria ananassa*) cv. winter dawn” was conducted during December 2021 to April 2022, in Horticulture Research Farm of Horticulture Department, Naini Agricultural Institute, Sam Higginbottom University of Agriculture, Technology and Sciences, Prayagraj (U.P) India. The results of the present investigation, regarding the cultivation of Strawberry with different concentrations of Zinc (Zn) and Iron (Fe) found as the best option for higher productivity whereas the treatment with concentration of Fe(0.6%) + Fe (0.6%) showed the best result in terms of plant height at 30 DAT (8.1cm), 60 DAT (15.4 cm) and 90 DAT (22.1cm), Number of leaves plant⁻¹ at 30 DAT(7.3), 60 DAT(21.3) and 90 DAT(27.4), Plant Spread (27.2 cm), runner plant⁻¹ (5.9), yield/ha (6.0 t), fruit length (4.3 cm), fruit weight (29.3 g), fruit diameter (3.4 cm), TSS (9.3° Brix), B:C ratio (3:8:1) showed the best results in terms of vegetative growth, yield, quality, economic returns and B:C ratio. Hence the T₃Zn (0.6%) + (0.6%) is best suited for the farmers in terms of growth, yield, quality and net returns.

Keywords: Strawberry, Growth, Yield and Quality

INTRODUCTION

Strawberry (*Fragaria x ananassa duch.*) is one of the most important temperate fruit belongs to the family Rosaceae. It is an octoploid (8x) in nature having (x=7) basic chromosome number. It is herbaceous, perennial and short-day plant. Among all the berries, strawberry gives the quickest return in a shortest possible time (Boriss *et al.*, 2006). It is an herbaceous perennial plant and is adapted to different climates, and can even be grown from tropical and sub-tropical to temperate regions of high altitudes up to 3000 Meter above mean sea level with assured irrigation facility. Strawberry is a low calorific carbohydrate fruit. It is a rich source of Vit. A (60 IU/100 g of edible portion), Vit. C (30-120 mg/100 g of edible portion), fiber and also has high pectin content (0.55%) available in the form of calcium pectate. Water is a major constituent of strawberry fruit. It contains 90% water. Ellagic acid is a naturally occurring plant phenol in its fruit. It's phenomenal increases in production during the recent years show the popularity of strawberry fruit cultivation. In India, the total area of strawberry is 1000 Ha with production of 5000 MT (Anonymous, 2015-16).

Maharashtra is the leading State in production of strawberry fruits. It is also commercially grown in Haryana, Punjab, Uttar Pradesh, Jammu and Kashmir, Uttarakhand and lower hills of Himachal Pradesh. As compared to other berry fruits strawberries contain a higher percentage of vitamin C, phenolics and flavonoids (Hakkinen and Torronen, 2000). It is commercially grown in China (38.7%), USA (17.5%), Mexico (4.9%), Turkey (4.8%), Spain (4%), total world production (Faostat, 2016). The area and production of strawberry in India during 2015-16 was reported 77 ha and 5602 mt respectively (NHB, 2016).

Comment [DDM1]: The author needs to add in the abstract methodology and treatments used in this study

Comment [DDM2]: This paragraph can not have only one citation.

Iron (Fe) deficiency induces chlorosis is a major nutritional disorder in calcareous soils (Alvarez et al., 2006). The phenotype introduced by hairpin RNAi-based silencing can be heritable, moreover the transcripts of multigene families can be silenced by a single construct making this technique a powerful tool to study the loss of function phenotype of a target gene in plants with high levels of polyploidy such as strawberry. Zinc is an important essential micronutrient for plant. Zinc is an essential metal for normal plant growth and development since it's a structural element of proteins and enzymes in living organisms. High concentrations of Zn in many soils indicated correct management methods including application of sewage sludge or animal manure. Therefore, present study was conducted to study the effect of foliar application of Iron and zinc on growth, yield and quality of strawberry in cv. Winter dawn.

Comment [DDM3]: Add citation

MATERIALS AND METHOD

A field experiment was conducted during December 2021 to April 2022. At Departmental field of Horticulture Department, Naini Agricultural Institute, Sam Higginbottom University of Agriculture, Technology and Sciences, Prayagraj (U.P.). The experiment entitled "Effect of foliar application of iron and zinc on growth, yield and quality of strawberry (*Frageria ananassa*) cv. Winter dawn" was conducted in rabi season adapting Randomized Block Design (RBD) consisting of 16 treatments and three replications. The treatments are T₀ (water spray), T₁ (Zn 0.2%+Fe 0.2%), T₂ (Zn 0.4%+Fe 0.4%), T₃ (Zn 0.6%+Fe 0.6%), T₄ (Zn 0.2%+Fe 0.4%), T₅ (Zn 0.2%+Fe 0.6%) T₆ (Zn 0.4%+Fe 0.2%) T₇ (Zn 0.4%+Fe 0.6%) T₈ (Zn 0.6%+Fe 0.4%) T₉ (Zn 0.6%+Fe 0.2%) , T₁₀ (Zn 0.2%), T₁₁ (Zn 0.4%), T₁₂ (Zn 0.6%) , T₁₃ (Fe 0.2%), T₁₄ (Fe 0.4%), T₁₅ (Fe 0.6%). The experimental field has an even topography with a gentle slope and good drainage. The soil samples were drawn from each replication of experimental plot at 0-15 cm depth before sowing of the crop and a composite sample was made to determine the physical and chemical properties of soil. Normal cultural practices and plant protection measures were followed during the cultivation process. Plants were selected randomly from each plot as representative sample for recording the data.

Iron and zinc applied to the seedlings of strawberry manually at of 30, 60 and 90 days after transplanting (DAT) as per treatments. Experimental data collected was subjected to statistical analysis by adopting Fisher's method of analysis of variance (ANOVA) as outlined in Panse and Sukhatme (1985). Critical difference (CD) values were calculated whenever the "F" test was significant at 5 per cent level.

Table 1: Treatment details

S.NO	Treatment Notations	Treatment Details
1.	T ₀	WATER SPRAY
2.	T ₁	Zn(0.2%)+Fe(0.2%)
3.	T ₂	Zn(0.4%)+Fe(0.4%)
4.	T ₃	Zn(0.6%)+Fe(0.6%)
5.	T ₄	Zn(0.2%)+Fe(0.4%)
6.	T ₅	Zn(0.2%)+Fe(0.6%)
7.	T ₆	Zn(0.4%)+Fe(0.2%)
8.	T ₇	Zn(0.4%)+Fe(0.6%)
9.	T ₈	Zn(0.6%)+Fe(0.4%)
10.	T ₉	Zn(0.6%)+Fe(0.2%)
11.	T ₁₀	Zn(0.2%)

Comment [DDM4]: Make sure that all the tables are cited in the text. I did not found any Table cited in the text

12.	T ₁₁	Zn(0.4%)
13.	T ₁₂	Zn(0.6%)
14.	T ₁₃	Fe(0.2%)
15.	T ₁₄	Fe(0.4%)
16.	T ₁₅	Fe(0.6%)

RESULTS AND DISCUSSION

Comment [DDM5]: The author(s) needs to relate their results with the findings from other related studies

The results revealed that strawberry had the following performance.

A. Growth parameters

Effect of iron and zinc on growth parameters on plant height (cm) at 30,60,90 DAT

The plant height (cm) was minimum at 30 days was observed with interaction of Zn and Fe (0.6%+0.6%) i.e., treatment T₃ (8.1 cm), followed by concentration of Zn and Fe (0.4%+0.6%) i.e., treatment T₇ (7.8 cm). Whereas minimum was recorded in treatment T₀ (5.4 cm) which consisted of water spray.

The maximum plant height at (60 days) was observed with interaction of Zn and Fe (0.6%+0.6%) i.e., treatment T₃ (15.4 cm), followed by concentration of Zn and Fe (0.4%+0.6%) i.e., treatment T₇ (15.1 cm). Whereas minimum was recorded in treatment T₀ (12 cm) which consisted of water spray.

The maximum plant height at (90 days) was observed with interaction of Zn and Fe (0.6%+0.6%) i.e., treatment T₃ (22.1 cm), followed by concentration of Zn and Fe (0.4%+0.6%) i.e., treatment T₇ (21.9 cm). Whereas minimum in treatment T₀ (16.9 cm) which consisted of water spray.

Zinc is a component of carbonic anhydrase as well as several dehydrogenases and auxin production which in turn enhance plant growth and iron is necessary for the biosynthesis of chlorophyll and cytochrome, leading to increase in the biosynthesis of materials and growth. Abdollahi et al., (2012) reported increased inflorescence and fruit size with ZnSO₄ application because of its important role in pollination and fruit set in strawberry, cultivar Selva. Increase in shelf life of berry might be due to the fact that zinc works as stimulant of amino acids and appears to be helpful in the process of photosynthesis.

Effect of iron and zinc on ~~growth parameters on~~ No. of leaves per plant at 30,60,90 DAT

The maximum no. of leaves at (30 days) was observed with interaction of Zn and Fe (0.6%+0.6%) i.e., treatment T₃ (7.3), followed by concentration of Zn and Fe (0.4%+0.6%) i.e., treatment T₇ (7.1). Whereas minimum was recorded in treatment T₀ (4.5) which consisted of water spray.

The maximum no. of leaves at (60 days) was observed with interaction of Zn and Fe (0.6%+0.6%) i.e., treatment T₃ (21.3), followed by concentration of Zn and Fe (0.4%+0.6%) i.e., treatment T₇ (21.0). Whereas minimum was recorded in treatment T₀ which consisted of water spray was (15.2).

The maximum no. of leaves at (90 days) was observed with interaction of Zn and Fe (0.6%+0.6%) i.e., treatment T₃ (27.4), followed by concentration of Zn and Fe (0.4+0.6) i.e., treatment T₇ (26.9). Whereas minimum was recorded in treatment T₀ which consisted of water spray was (20.2).

Effect of iron and zinc on ~~growth parameters on~~ plant spread and no. of fruits per plant at 90 DAT

The maximum plant spread at (90 days) was observed with interaction of Zn and Fe (0.6%+0.6%) i.e., treatment T₃ (27.2), followed by concentration of Zn and Fe (0.4%+0.6%) i.e., treatment T₇ (26.9). Whereas minimum plant spread (90 days) was recorded in treatment T₀ which consisted of water spray was (23.2).

The maximum no. of fruits per plant at (30 days) was observed with interaction of Zn and Fe (0.6%+0.6%) i.e., treatment T₃ of (20.4), followed by concentration of Zn and Fe (0.4%+0.6%) i.e., treatment T₇ of (20.0). Whereas minimum no of fruits per plant (30 days) in treatment T₀ which consisted of water spray was (12.1).

Foliar application is based on the principle that the nutrients are quickly absorbed by leaves and transported to different parts of the plant to fulfil the functional requirement of nutrition. Foliar application of the nutrients is obviously an ideal way of evading the problems of nutrient availability. Zinc and boron have important role on pollination; fruit set and yield (Motesharezade et al., 2001) among the micronutrients.

B. Yield Parameters

The maximum yield/ha was observed with interaction of Zn and Fe (0.6%+0.6%) i.e., treatment T3 of (6.0), followed by concentration of Zn and Fe (0.4%+0.6%) i.e., treatment T7 of (5.4). Whereas minimum yield/ha in treatment T0 which consisted of water spray was (2.3).

Among various micro-nutrients, iron (Fe) and zinc (Zn) plays an important role in promoting vegetative growth, flowering, yield and quality of strawberry fruits (Chaturvedi et al., 2005)

The maximum fruit length was observed with interaction of Zn and Fe (0.6%+0.6%) i.e., treatment T3 of (4.3 cm), followed by concentration of Zn and Fe (0.4%+0.6%) i.e., treatment T7 of (4.1 cm). Whereas minimum fruit length in treatment T₀ which consisted of water spray was (3.2 cm).

The maximum fruit weight was observed with interaction of Zn and Fe (0.6%+0.6%) i.e., treatment T3 of (29.3 g), followed by concentration of Zn and Fe (0.4%+0.6%) i.e., treatment T7 of (27.1g). Whereas minimum fruit weight in treatment T₀ which consisted of water spray was (18.6 g).

The maximum fruit diameter was observed with interaction of Zn and Fe (0.6%+0.6%) i.e., treatment T₃ of (3.4 cm), followed by concentration of Zn and Fe (0.4%+0.6%) i.e., treatment T₇ of (3.3 cm). Whereas minimum fruit diameter in treatment T₀ which consisted of water spray was (2.6 cm).

The number of fruits per plant, mean fruit weight, diameter and volume of fruit significantly increased with the application of Zinc (0.6%) alone or with Iron (0.4%) in fruit plants. Bhambota *et al.*, (1962).

C. Quality Parameters

The maximum TSS was observed with interaction of Zn and Fe (0.6%+0.6%) i.e., treatment T3 of (9.3 o Brix), followed by concentration of Zn and Fe (0.4%+0.6%) i.e., treatment T7 of (9.1 o Brix). Whereas minimum TSS in treatment T₀ which consisted of water spray was (6.3 o Brix).

Foliar application of zinc increases fruit size, total soluble solids (TSS) (Dixi and Gamdagin, 1978) also increasing sugar and decreasing acidity (Abedy, 2001).

Table 2: Effect of iron and zinc on growth parameters

Treatments	Combinations	Plant Height (cm)			No. of leaves per plant			Plant spread (cm)	No. of fruits per plant
		30 DAT	60 DAT	90 DAT	30 DAT	60 DAT	90 DAT	90 DAT	90 DAT
T0	Water Spray	5.4	12.0	16.9	4.5	15.2	20.2	23.2	12.1

CONCLUSION

Based on the results of the present investigation entitled Effect of Foliar Application of Iron (Fe) and Zinc (Zn) on growth, yield and quality of strawberry (*Fragaria ananassa*) cv. winter dawn. it is concluded that cultivation of strawberry with different concentrations of Zn & Fe found as the best for higher productivity whereas the treatment cv. Winter dawn T3 Zn (0.6%)+Fe (0.6%) showed the best results in terms of vegetative growth, yield, quality, economic returns and B:C ratio. Hence the T3 (0.6%)+ Fe(0.6%) is best suited for the farmers in terms of growth, yield, quality and net returns.

Comment [DDM6]: What is C:B ratio? How is it calculated? I have just seen it in the abstract and conclusion only. But no where to be found in the other part of the text. I expected to find it in the methodology part and in the result section
