CBNAAT: ADVANTAGE AND EFFICACY IN PULMONARY TUBERCULOSIS (PTB) ATOP ON TRADITIONAL METHODS FOR DIAGNOSIS IN A TERTIARY CARE HOSPITAL OF INDIA

ABSTRACT

Background: *Mycobacterium Tuberculosis* (MTB) is one of the most ancient diseases of mankind. Pulmonary tuberculosis (PTB) is the most common, in spite of the diagnosis and treatment of TB. Many studies reported a collaboration between PTB susceptibility. In our research study we report meantime findings after enrolling 732 of a planned 212 subjects.

Comment [BAR1]: Better use word "participants" or "patients" instead of "subjects".

Study design: A descriptive cross-sectional study.

Methods: The study conducted on patients with TB in west India was conducted in the Department of Microbiology, Index Medical College; Indore Madhya Pradesh. Patients suspected of PTB were qualified for screening if their age varies from 25 to 60 years and with both gender, signs and symptoms associated with PTB such as cough for more than 2 weeks, fever, weight loss, chest pain, and abnormal chest X-ray findings in end results and CBNAAT positive. All Patients were monitored monthly while they visited in TB and chest clinic for TB treatment.

Comment [BAR2]: Use past tense "varied". Do this in the other parts of the manuscript too.

Comment [BAR3]: "For", not "of".

Comment [BAR4]: Use full form on first time usage.

Results: The total of 937 patients were registered in the TB and chest clinic which were as have a suspicion of TB but at most 732 patients were enrolled on the basis of age criterion and out of 732 only 212 were entitled and found verifiable positive in our research study after confirmed through CBNAAT.

Comment [BAR5]: This sentence is very long. Make the sentence shorter and divide into more than one small sentences. Also, this sentence is incorrect grammatically. Revise it and make easily understandable sentences.

Conclusion: The current scenario of traditionally AFB negative Pulmonary Tuberculosis (PTB) is not sensitive enough to establish the diagnosis of active tuberculosis without CBNAAT. They under diagnose PTB and over-treat people without PTB.

Comment [BAR6]: Just use PTB only, as this abbreviation is already mentioned in 2nd sentence of the Abstract.

8

9 KEYWORDS: TB (Tuberculosis), PTB (Pulmonary Tuberculosis), MDR-TB (Multi drug-
10 resistance tuberculosis), CBNAAT, GeneXpert, MDR

11 1.Introduction

12 *Mycobacterium Tuberculosis* (MTB) only the most prehistoric diseases of society, is one of
13 the leading causes of mortality from a single infectious medium^{1,2}. The emergence of
14 increasingly drug resistant forms of tuberculosis (TB) is a considerable challenge to current
15 and future TB prevention and care efforts. In spite of recent progress in addressing the
16 epidemic, TB persist one of the major causes of mortality globally with an estimated 10.5
17 million new cases and 1.6 million deaths singly in 2016. Multi-drug resistant TB (MDR TB)
18 resistant to at least the two most effective first-line anti-TB drugs (Rifampicin and Isoniazid),
19 and Rifampicin-resistant TB (RR TB) were estimated to have caused 580,000 of these new
20 cases and an excessive in high number of deaths².

Comment [BAR7]: This sentence is very long.

21 MDR TB with supplementary Fluoroquinolones and Aminoglycosides resistance (i.e.
22 extensively drug resistant TB, XDR TB) many times results in even poorer treatment end
23 result. The action towards of MDR and XDR TB although cost-effective leftovers overpriced
24 with methodical costs 10-200 times that of DS TB and direct and indirect costs to patients
25 often surpass $\geq 20\%$ of their annual household earning^{3,4,5,6,7}.

Comment [BAR8]: Earnings.
Please correct the English language in all parts of
the manuscript.

26 Multidrug-resistant tuberculosis (MDR-TB) bully TB control global, it results from
27 incompatible with or mistaken TB treatment or direct person-to-person transferral⁸.
28 Differentiate to drug-susceptible TB, MDR-TB is far mortal and current treatments are
29 overpriced, prolonged, and often cause acute side-effects⁹. Patients faces many financial,
30 biological, systemic barriers and psychosocial to treatment compliance, which constantly
31 steer to poor end result and elaboration of drug-resistance^{10,11,12}.

Comment [BAR9]: Patients face.

32 The National Strategic Plan (2017–25) of India suggests strong master plan with equivalent
33 resources to rapidly diminish TB in the country by 2030. This is in pipeline with the worldwide
34 end TB targets and defensive development goals to achieve the innovation of TB free India.
35 The goal is to attain a quick diminish in burden of TB, morbidity and mortality while working
36 towards exclusion of TB in India by 2025¹³. Whereas WHO with its "STOP TB" strategy has
37 given a vision to eliminate TB as a public health problem from the face of this earth by
38 2050¹⁴.

39 Health-related quality of life during MDR TB treatment generally, the focus of TB treatment
40 has been on attain microbiological cure with less significance on morbidity and patient-
41 reported end result, similarly quality of life (QOL). Health-related quality of life is a multi-
42 dimensional construct that point up the patient's viewpoint and defines health as physical,
43 mental and social welfare rather than rigidly the truancy of illness¹⁵.

44 As patient standard of life and treatment authority are key drivers of treatment beneficial end
45 result and dropping to gape within an opportunity for arbitration. Some socioeconomic
46 convincing also connected with lack of success of MDR-TB treatment such as lack of
47 education, small income alcohol misuse, joblessness and be lacking of health insurance^{16,17}.

48 As studies that assess the merger of extended authority have not been smoothly directed in
49 countries with an elevated burden of TB without proper and facts related studies that impact
50 the victory of MDR-TB make use of prolonged treatment authority¹⁸. Hence in this research

51 study, we sight to pinpoint the elements, particularly connected with favorable outcome
52 treatment in high burden MDR-TB setting in India.

53 2. MATERIALS AND METHODS

54 The study was conducted in the Department of Microbiology at Index Medical College
55 Hospital and Research Centre, Indore (M.P.)

Comment [BAR10]: Use full form on first time usage.

56 2.1SAMPLE SIZE

57 A total number of 732 samples were collected which includes sputum, bronchoalveolar
58 lavage and gastric aspirate.

Comment [BAR11]: Please explain how did you calculate the sample size?

59 2.2 STUDY DURATION

60 Two years (July 2019 – July 2021) including 2 years of data analysis.

61 2.3 STUDY POPULATION

62 Patients visited in TB and chest clinic and diagnosed for pulmonary tuberculosis (PTB). We
63 included all the age groups and gender after taking written informed consent in our study.

Comment [BAR12]: This sentence is grammatically wrong.

64 2.4 INCLUSION CRITERION

65 Patients were qualified for screening if their age varies from 25 to 60 years and with both
66 gender, signs and symptoms associated with PTB such as cough more than 2 weeks, fever,
67 weight loss, chest pain and abnormal chest X-ray findings in end results and CBNAAT
68 positive.

Comment [BAR13]: Please explain what were the "abnormal chest x-ray findings"?

69 2.5 EXCLUSION CRITERION

70 Patients were dis-qualified for screening if they were below than 25 years and more than 60
71 years of age. Patients with pre diabetic history were also excluded from the study.

Comment [BAR14]: Please explain the reason why these patients were excluded?

72 2.6Specimen Collection (PTB)

73 Two consecutive morning speck sputum samples will be collected from suspected cases of
74 PTB as per RNTCP protocol in a sterile, wide mouthed, triple layer-leak proof plastic
75 container. All the patients were directed to cough deeply to produce sputum specimen and to
76 collect without contaminating the sample collection container. If the patient is unable to
77 produce sputum as in the case of children or elderly patients, gastric aspirate and
78 bronchoalveolar lavage fluid (BAL) will be accepted for further processing.

79 2.7Transport

80 The specimens transported from concern departments to central laboratory by maintaining
81 cold chain with triple layer packaging.

82 2.8 Sample processing:

83 I. All specimens processed by taking aseptic precautions and personal
84 protective equipment(PPE) properly in BSL-II laboratory.
85
86
87

88 II. Visually, the grade of sputum specimen will be judged for consistency and if
 89 it carries more saliva then the specimen will be rejected and asked for a new
 90 specimen.
 91

92 **2.9 Smear Microscopy:** All smears will be prepared directly from the specimens and
 93 stained with Z-N staining. Specimen with two negative smears will be documented. These
 94 patients will be engage in conversation. Research Study Performa will be filled up for those
 95 with clinico-radiological suspicious of pulmonary tuberculosis (PT) & are willing to agree for
 96 participation in the research study. Enrolled patient's specimen will be further processed.
 97 After observing minimum 100 fields for acid-fast bacilli in a smear was an indication of the
 98 PT infection severity in patients. AFB smears which were positive, reported in grading as
 99 shown in **Table 1**¹⁹.

Comment [BAR15]: Use Past tense, not Future tense.

100 **TABLE 1: GRADING OF AFB SMEARS**

No acid-fast Bacilli (AFB)	Fields	Report
No AFB	In 100 immersion fields	Negative
1-9 AFB	In 100 immersion fields	Positive scanty Record exact figure
10 to 99 AFB	In 100 immersion fields	1+
1 to 10 AFB	Per field (examine 50 fields)	2+
More than 10 AFB	Per field (examine 20 fields)	3+

102
 103 **2.10. MIDDLEBROOK 7H9 BROTH CULTURE**

104 **2.10.1. DECONTAMINATION PROCEDURE**

- 105 1. 4% NaOH, 2-3 times volume of solution will be added to an allowable specimen and
- 106 left there at 37°C for 30 minutes until the sample is completely liquidize.
- 107 2. Ather part of liquidize specemen is separated into 1.5ml Micro Centrifuge Tube
- 108 (MCT) additionally for processing of liquid culture medium.
- 109 3. Liquidize sample of 900µl alongside with 500µl Negative Control and 500µl Positive
- 110 Control will be dispense into a disparate 1.5ml MCT tubes.
- 111 4. Centrifuged to all MCT tubes for 10 minutes at 13,000rpm.
- 112 5. Discard the upper liquid phase and add 1ml sterile physiological saline to the
- 113 precipitate and vortex it, to put back into suspension.
- 114 6. Centrifuged all tube for 10 minutes at 13,000rpm and discard the upper liquid phase.
- 115

116 **2.10.2. PROCEDURE**

117 One MCT tube pallet cultured into Middlebrook 7H9 broth. One smear will be checked by Z-N
 118 staining. Result will be recorded. Middlebrook 7H9 broth supplemented with 0.8 ml OADC
 119 and PANTA will be used for liquid culture. It will be prepared as per manufacturer's

120 instruction Hi Media (Hi Media Pvt Ltd, Mumbai, India). 0.5 ml of processed sample will be
121 inoculated and tubes will be incubated at 37 +/- 1°C. Readings will be taken visually twice
122 weekly up to 6 weeks. Positive culture with granular appearance without significant turbidity
123 will be noted. If growth is observed, Z-N staining will be done to confirm the presence of
124 AFB.
125

126 2.11. CBNAAT

127 It is a novel rapid automated machine for the rapid diagnosis of TB. This is the cartridge-
128 based nucleic acid amplification test (CBNAAT) that can detect TB within 2 h of collection
129 along with RIF's resistance directly from the pulmonary samples. Detection based on the
130 target sequences and nucleic acid amplification by RT-PCR and reverse transcriptase. In
131 conical tube containing 1ml of a sample (Sputum, BAL, and gastric aspirate), 2 ml of sample
132 reagent added and mixed vigorously. This mixture incubated at room temperature for 10 to
133 15 minutes and treated sample transferred into the sample cartridge chamber by using a
134 sterile graduated or ungraduated pipette and then cartridge loaded into the GeneXpert
135 machine. Result Interpretation done by using GeneXpert Dx System software, which
136 measured fluorescent signals algorithm¹⁶.

137 3. RESULT

138 The total 937 patients were registered in TB and chest clinic which were as have a suspicion
139 of TB but at most 732 patients were enrolled on the basis of age criterion and out of 732 only
140 212 were entitled and found verifiable positive in our research study after confirmed through
141 CBNAAT as shown in table-2. The rest (520 patients) were found negative. In the number of
142 732 samples which were suspected for MTB, 212 (28.96%)
143 samples were confirmed positive for MTB by CBNAAT (GeneXpert) comparatively with smear
144 and culture as summarized in Table 2.

145 Out of 212 positive TB cases, most of the patient do not had past history of tuberculosis but
146 positivity were high as compare to patients with family history of TB. Suspected male
147 patients also show high positivity rate as compare to suspected female patients with include
148 alcohol consumption and smoking as shown in socio-economic demographic Table 3.

175

176 4. DISCUSSION

177 In this research study, we have evaluate the role of GeneXpert over regular methods for
 178 MTB and Rifampicin-resistant detection in pulmonary specimens (Sputum, Gastric aspirate
 179 and BAL) since PT is the foremost cause for mortality and morbidity in India. In our research
 180 study MTB was generally high in urban community in comparison with rural community and
 181 that is alike with the study at Madurai, India in 2015 and Madhya Pradesh in 2016^{20,21,22}.
 182 The most important and regular indicator in our research study were fever (70.19%) and
 183 cough (68.71%). In a corresponding research study from Avashia *et al.*, in 2016, as they
 184 base fever (69.4%) and cough (72.2%) as the main indicator. One of radiological finding
 185 infiltration was most familiar (71.90%) followed by consolidation (30.19%) in positive PTB
 186 cases in our research study, which was almost alike with the study done by Avashia *et al.*, in
 187 2016 and Ganesh CM *et al.*, in 2018 bases consolidation in 33.3% and infiltration in 79% of
 188 sufferer correspondingly^{21,23}. In our research study, 73% of patients who were newly

189 exposed of PTB in the number of all positive cases for MTB, which was compatible (71%)
190 with other research study shore up by Subbarao *et al.*, in 2018²⁴.

191 Besides using CBNAAT, so far a extended span of Rifampicin resistance was clock in ²⁵. In
192 a research study by Ikuabeet *al.*, in 2018^{25, 26}. Some of CBNAAT positive samples had
193 Rifampicin resistance in 14.7%, whichever was nearly comparable to our research study
194 (15.42%), but in a divergent research work by Lee *et al.*, 2013 reported 5.7% resistance.
195 RIF's resistance by CBNAAT is considered to be a substitute indicator of MDR-TB^{27, 28}.

196 Barely 212 CBNAAT positive samples were Rifampicin resistant, that was relatively towering
197 as relate with other research work study specify multidrug-resistant tuberculosis (MDR-TB)
198 since commonness of MDR-TB is changeable in literary texts and it is assorted and be
199 contingent next to numerous element; distinct quantity of resistance may be attributable to
200 discrepancy in mutation, co-infected with HIV and scanty or unsuitable dosage of anti-TB
201 therapy²⁶. Resistance through these medications in mycobacterium strain was considering
202 not long in the rear of clinical presentation. To this extent the evolution of newly discovered
203 chemical amalgamation to act towards MTB, few newly medications in the channel, yet
204 these are up to this time in introductory clinical phase²⁹.

Comment [BAR17]: Very lengthy sentence.

205 5. CONCLUSION

206 The current scenario of traditionally AFB negative Pulmonary Tuberculosis (PTB) is not
207 sensitive enough to establish the diagnosis of active tuberculosis without CBNAAT. They
208 under-diagnose PTB and over treat people without PTB. PTB add up to a uttermost of all
209 tuberculosis which is surrounded by more than half to bear a resemblance as negative-
210 smear and it is very arduous to compel a bacteriological identification for negative TB
211 specimen²³. Detection by CBNAAT for PTB with high specificity and sensitivity rather than
212 liquid culture medium and microscopy of sputum samples that is why CBNAAT detects MTB
213 rapidly and correctly in less than 2 hours. At the same time CBNAAT additionally discover
214 RIF's for MDR-TB screening and patient prompt treatment perhaps decline the new victim
215 graph prevalence³⁰.

216 ETHICAL APPROVAL

217 This study was approved by Independent Ethics Committees (IEC), Index Medical College
218 Hospital & Research Center (Malwanchal University) vide- MU/Research/EC/Ph.D/2019/51.

219 SOURCE OF SUPPORT

220 Revised national tuberculosis control program (RNTCP), Govt. of India, State TB cells,
221 Bhopal, Madhya Pradesh and District health society (DHS), Indore, Madhya Pradesh.
