

Editor's Comment:

The revised manuscript submitted to my appreciation is not on a "tracked form", no correction is highlighted on this manuscript. In addition, according to the reviewer's feedbacks, and my own lecture. Some clarifications merit to be brought to this paper. As followed, some remarks to be revised:

→ Background

- The authors should talk about the different type of insecticides and their mode of action to justify the choice of these four groups.

→ Materials and methods

- Explanations are needed for the second paragraph of the "*Mosquitoes*" subtitle. In fact, it is clear that adult strains used for the bioassay were from the collected larvae. However, the origin of larvae used for bioassays is fuzzy.

- The procedure from (WHO, 1981) is not among the cited references. In addition, this version is so old. There is no newer version?

→ Throughout the text

- Some signs (symbols) appear in Chinese in this revised version. Examples are: 0.005- 0.003 礫; mean 鹵 S.E.M; P 鋸 0.05; etc.

→ Result

- Table 2 and Figure 1 are not called on the text.

- Fore Figure 1, the blue color should be changed because it do not appear in the black front.

→ Discussion

- The discussion is very short and poor of references with only 6 references.

→ References

- All the cited references do not appear in the references section (ex: WHO, 2018; Pridgeon et al, 2008) and there are some errors (Sandra, 2010, with 2011 is the reference section).

In definitive, we recommend "Minor revision".
