

# ACTION OF THE SYMMETRIC GROUP $S_7$ ON UNORDERED PAIRS

## ABSTRACT

In this paper some properties of Symmetric group  $G = S_7$  on  $X^{(2)}$  are investigated. It is shown that  $G$  acts transitively, primitively but not doubly transitively on  $X^{(2)}$ . The orbits of  $G_{\{1,2\}}$  acting on  $X^{(2)}$  and the orbits of  $G$  acting on  $X^{(2)} \times X^{(2)}$  are found to be 3. Suborbital graphs corresponding to the action of  $G$  on  $X^{(2)} \times X^{(2)}$  are constructed. Some theoretic properties of these graphs are discussed.

**Keywords:** Transitive, Orbits, Suborbits, Suborbital graphs

### 1.0 Introduction

Let  $G = S_7$  acting naturally on  $X = \{1, 2, 3, 4, 5, 6, 7\}$ . Then  $G$  acts on  $X^{(2)}$ , the set of 21 unordered pairs from the set  $X$  by the rule

$$g\{x, y\} = \{gx, gy\}, \forall g \in G, \{x, y\} \in X^{(2)}.$$

### 1.1 Definition

Let  $X$  be a set. The group  $G$  acts on the left on  $X$  if for each  $g \in G$  and each  $x \in X$  there corresponds a unique element  $gx \in X$  such that -:

- i.  $(g_1g_2)x = g_1(g_2x), \forall g_1, g_2 \in G$  and  $x \in X$
- ii. For any  $x \in X$   $1x = x$ , where 1 is the identity in  $G$ .

### 1.2 Definition

If the action of a group  $G$  on a set  $X$  has only one orbit, then we say that  $G$  acts transitively on  $X$ . In other words,  $G$  acts transitively on  $X$  if for every pair of points  $x, y \in X$ , there exist  $g \in G$  such that  $gx = y$ .

### 1.3 Definition

A group  $G$  is said to act doubly transitively on a set  $X$  if and only if given  $a, b, c, d \in X$  with  $a \neq b$  and  $c \neq d$ , then there exists  $g \in G$  such that  $ga = c$  and  $gb = d$ .

#### 1.4 Definition

Let  $G$  act transitively on a set  $X$ . Then a subset  $B$  of  $X$  is a block if  $gB = B$  or  $gB \cap B = \emptyset$  for  $g \in G$ . Clearly the set  $X$  and the singleton subsets of  $X$  form blocks; these blocks are called trivial blocks. If these are the only blocks, then we say that  $G$  acts primitively on  $X$ . Otherwise  $G$  acts imprimitively.

#### 1.5 Theorem [Cauchy-Frobenius Lemma]

Let  $G$  be a finite group acting on a set  $X$ . Then the number orbits of  $G$  is  $\frac{1}{|G|} \sum_{g \in G} |Fix(g)|$ ,

where  $|Fix(g)|$  denotes the number of points in  $X$  fixed by  $g$ .

[Harary, 1955]

#### 1.6 Theorem

Two permutations in  $S_n$  are conjugate if and only if  $g \in G$  has cycle type

$(\alpha_1, \alpha_2, \alpha_3, \dots, \alpha_n)$ , then the number of permutations in  $S_n$  conjugate to  $g$  is  $\frac{n!}{\prod_{i=1}^n \alpha_i \cdot i^{\alpha_i}}$ .

[Krishnamurthy, 1985]

#### 1.7 Theorem

$G_x$  has an orbit different from  $\{x\}$  and paired with itself if and only if  $G$  has even order.

We notice that  $G$  acts on  $X \times X$  by  $g(x, y) = (gx, gy)$ ,  $g \in G, x, y \in X$ . If  $O \subseteq X \times X$  is a  $G$ -Orbit, then for a fixed  $x \in X$ ,  $\Delta = \{y \in X \mid (x, y) \in O\}$  is a  $G_x$ -Orbit. Conversely, if  $\Delta \subset X$  is a  $G_x$ -Orbit, then  $O = \{(gx, gy) \mid g \in G, y \in \Delta\}$  is a  $G$ -orbit on  $X \times X$ . We say  $\Delta$  corresponds to  $O$ .

The  $G$ -orbits on  $X \times X$  are called suborbitals. Let  $O_i \subseteq X \times X, i = 0, 1, \dots, r-1$  be a suborbital.

Then we form a graph  $\Gamma_i$ , by taking  $X$  as the set of vertices of  $\Gamma_i$  and by including a directed edge from  $x$  to  $y (x, y \in X)$  if and only if  $(x, y) \in O_i$ . Thus each suborbital  $O_i$  determines a

suborbital graph  $\Gamma_i$ . Now  $O_i^* = \{(x, y) \mid (y, x) \in O_i\}$  is a  $G$ -Orbit. Let  $\Gamma_i^*$  be the suborbital graph

corresponding to the suborbital  $O_i^*$ . Let the suborbits  $\Delta_i (i = 0, 1, \dots, r-1)$  correspond to the

suborbital  $O_i$ . Then  $\Gamma_i$  is undirected if  $\Delta_i$  is self-paired and  $\Gamma_i$  is directed if  $\Delta_i$  is not self-paired. [Wielandt, 1964]

**Theorem 1.8 [Kamuti, 2004]**

The counting polynomial for digraphs with  $p$  points is  $d_p(x) = Z(S_p^{[2]}, 1+x)$ .

**2.0 RESULTS AND DISCUSSION**

**2.1 Some properties of the action of  $G$  on  $X^{(2)}$**

**Lemma 2.1.1**

$G$  acts transitively on  $X^{(2)}$ .

**Proof**

By Definition 1.2, we only need to use the Theorem 1.5 to show that the action of  $G$  on  $X^{(2)}$  has one orbit.

Let  $g \in G$  have cycle type  $(\alpha_1, \alpha_2, \dots, \alpha_n)$ , then the number of permutations in  $G$  having the same cycle type as  $g$  is given by Theorem 1.6 and

$$|Fix(g)| = \binom{\alpha_1}{2} + \alpha_2.$$

We now have the following table

**Table .1: Permutation in  $G$  and the number of fixed points**

| Permutation $g$ in $G$ | Number of permutations | $ Fix(g) $ |
|------------------------|------------------------|------------|
| I                      | 1                      | 21         |
| (ab)                   | 21                     | 11         |
| (abc)                  | 70                     | 6          |
| (abcd)                 | 210                    | 3          |
| (abcde)                | 504                    | 1          |
| (abcdef)               | 840                    | 0          |
| (abcdefg)              | 720                    | 0          |
| (ab)(cd)(ef)           | 105                    | 3          |
| (ab)(cd)(efg)          | 210                    | 2          |
| (ab)(cdefg)            | 504                    | 1          |

|             |     |   |
|-------------|-----|---|
| (ab)(cd)    | 105 | 5 |
| (ab)(cdef)  | 630 | 1 |
| (abc)(def)  | 280 | 0 |
| (ab)(cde)   | 420 | 2 |
| (abc)(defg) | 420 | 0 |

Now applying Theorem 1.5 we get:

$$\begin{aligned}
\text{number of orbits of } G \text{ acting on } X^{(2)} &= \frac{1}{|G|} \sum_{g \in G} |Fix(g)| \\
&= \frac{1}{7!} [1 \times 21 + 11 \times 21 + 6 \times 70 + 3 \times 210 + 1 \times 504 + 0 \times 840 + 0 \times 720 + 3 \times 105 + 2 \times 210 + 1 \times 504 \\
&\quad + 5 \times 105 + 1 \times 630 + 0 \times 280 + 2 \times 420 + 0 \times 420] \\
&= \frac{1}{7!} [21 + 231 + 420 + 630 + 504 + 315 + 420 + 504 + 525 + 630 + 840] \\
&= \frac{1}{5040} [5040] \\
&= 1
\end{aligned}$$

Therefore  $G$  acts transitively on  $X^{(2)}$ .

**Lemma 2.1.2**

$G$  does not act doubly transitively on  $X^{(2)}$ .

**Proof**

By Definition 1.3,  $G$  does not act doubly transitively on  $X^{(2)}$  because for example there is no element of  $G$  which takes  $\{1,2\}$  to  $\{1,2\}$  and  $\{1,3\}$  to  $\{4,5\}$ .

**Lemma 2.1.3**

$G$  acts primitively on  $X^{(2)}$ .

**Proof**

By definition 1.4, if  $G$  acts imprimitively on  $X^{(2)}$  then its blocks of imprimitivity have length 3 or

7. Now if  $B$  is a block containing  $\{1,2\}$ , then for  $g \in G_{\{1,2\}}$ ,  $gB = B$  or  $gB \cap B = \emptyset$ . But

$\{1, 2\} \in B \cap gB$ , so  $gB = B$ . Therefore  $B$  is invariant under  $G_{\{1,2\}}$ , so  $B$  is a union of some orbits of  $G_{\{1,2\}}$ . Since the orbits of  $G_{\{1,2\}}$  have lengths 1, 10, 10 (as we shall see in Section 2.2), this gives a contradiction. Hence  $G$  acts primitively on  $X^{(2)}$ .

## 2.2 Orbits of $G$ acting on $X^{(2)} \times X^{(2)}$ and the corresponding suborbital graphs

### Lemma 2.2.1

The number of orbits of  $G_{\{1,2\}}$  acting on  $X^{(2)}$  is 3.

#### Proof

We need to apply the Theorem 1.4 to get the number of orbits of  $G_{\{1,2\}}$  on  $X^{(2)}$ . A permutation in  $G_{\{1,2\}}$  is either of the form  $(1)(2)(\dots)(\dots)\dots(\dots)$  or  $(12)(\dots)\dots(\dots)$ . Thus  $g \in G_{\{1,2\}}$ , if either it fixes or transposes 1 and 2. If  $g$  has cycle type  $(\alpha_1, \alpha_2, \dots, \alpha_n)$  and  $g$  is of the form

$(1)(2)(\dots)(\dots)\dots(\dots)$ , then the number of permutations in  $G_{\{1,2\}}$  with the same cycle type as  $g$  is

$$\frac{(n-2)!}{1^{(\alpha_1-2)}(\alpha_1-2)! \prod_{i=2}^n \alpha_i i^{\alpha_i}},$$

and if  $g$  is of the form  $(12)(\dots)\dots(\dots)$  then the number of permutations in  $G_{\{1,2\}}$  with the same type as  $g$  is

$$\frac{(n-2)!}{1^{\alpha_1} \alpha_1! (\alpha_2-2)! 2^{(\alpha_2-2)} \prod_{i=3}^n \alpha_i i^{\alpha_i}}$$

Now  $|Fix(g)| = \binom{\alpha_1}{2} + \alpha_2$

in each case

We now have the following table

**Table 2: Permutation in  $G_{\{1,2\}}$  and the number of fixed points**

| Permutation in $G_{\{1,2\}}$ | Number of permutations | $ Fix(g) $ |
|------------------------------|------------------------|------------|
|------------------------------|------------------------|------------|

|                     |            |    |
|---------------------|------------|----|
| I                   | 1          | 21 |
| (1)(2)(ab)(c)(d)(e) | 10         | 11 |
| (12)(a)(b)(c)(d)(e) | 1          | 11 |
| (12)(ab)(cd)(e)     | 15         | 3  |
| (1)(2)(abc)(d)(e)   | 20         | 6  |
| (1)(2)(abcd)(e)     | 30         | 3  |
| (1)(2)(abcde)       | 24         | 1  |
| (1)(2)(ab)(cde)     | 20         | 2  |
| (1)(2)(ab)(d)(e)    | 15         | 5  |
| (12)(ab)(c)(d)(e)   | 10         | 5  |
| (12)(abc)(de)       | 20         | 2  |
| (12)(abcd)(e)       | 30         | 1  |
| (12)(abcde)         | 24         | 1  |
| (12)(abc)(d)(e)     | 20         | 2  |
| <b>Total</b>        | <b>240</b> |    |

Now applying Theorem 1.5 we get;

number of orbits of  $G_{\{1,2\}}$  on  $X^{(2)}$

$$\begin{aligned}
&= \frac{1}{|G_{\{1,2\}}|} \sum_{g \in G_{\{1,2\}}} |Fix(g)| \\
&= \frac{1}{240} [1 \times 21 + 10 \times 11 + 1 \times 11 + 15 \times 3 + 20 \times 6 + 30 \times 3 + 24 \times 1 \\
&\quad + 20 \times 2 + 15 \times 5 + 10 \times 5 + 20 \times 2 + 30 \times 1 + 24 \times 1 + 20 \times 2] \\
&= \frac{1}{240} \times 720 \\
&= 3
\end{aligned}$$

The three orbits of  $G_{\{1,2\}}$  acting on  $X^{(2)}$  found in Lemma 2.2.1 are;

$$Orb_{G_{\{1,2\}}} \{1, 2\} = \{\{1, 2\}\} = \Delta_0, \text{ the trivial orbit.}$$

$$Orb_{G_{\{1,2\}}} \{1, 3\} = \{\{1, 3\}, \{1, 4\}, \{1, 5\}, \{1, 6\}, \{1, 7\}, \{2, 3\}, \{2, 4\}, \{2, 5\}, \{2, 6\}, \{2, 7\}\} = \Delta_1$$

which is the set of all unordered pairs containing exactly one of 1 or 2.

$Orb_{G_{(1,2)}} \{3,4\} = \{\{3,4\}, \{3,5\}, \{3,6\}, \{3,7\}, \{4,5\}, \{4,6\}, \{4,7\}, \{5,6\}, \{5,7\}, \{6,7\}\} = \Delta_2$ , the set of all unordered pairs containing neither 1 nor 2.

Thus the rank of  $G$  on  $X^{(2)}$  is 3 and the subdegrees are 1, 10, 10.

We now concentrate on the non-trivial suborbits  $\Delta_1$  and  $\Delta_2$ , since the suborbital graphs corresponding to  $\Delta_0$  is the null graph and therefore not very interesting.

Since  $|G| = 7!$  is even, then by Theorem 1.7,  $\Delta_1$  and  $\Delta_2$  are self-paired and therefore their corresponding suborbital graphs  $\Gamma_1$  and  $\Gamma_2$  are undirected.

By the theory developed in Theorem 1.7, the suborbital  $O_1$  corresponding to the suborbit  $\Delta_1$  is  $O_1 = \{(g\{1,2\}, g\{1,3\}) | g \in G\}$ . Thus the suborbital graph  $\Gamma_1$  corresponding to the suborbital  $O_1$  has two 2-element subsets  $S$  and  $T$  from  $X = \{1,2,\dots,7\}$  adjacent if and only if  $|S \cap T| = 1$ .

On the other hand the suborbital  $O_2$  corresponding to the suborbit  $\Delta_2$  is

$O_2 = \{(g\{1,2\}, g\{3,4\}) | g \in G\}$  and suborbital graph  $\Gamma_2$  corresponding to  $O_2$  has two 2-element subsets  $S$  and  $T$  from  $X = \{2,3,\dots,7\}$  adjacent if and only if  $|S \cap T| = 0$

The two graphs are also complementary. A little calculation shows that the two graphs are regular of degree 10.

Since vertices for example  $\{2,7\}$ ,  $\{2,5\}$  and  $\{2,3\}$  are connected in  $\Gamma_1$  and say  $\{4,7\}$ ,  $\{3,6\}$  and  $\{2,5\}$  are connected in  $\Gamma_2$ , then these graphs are of girth 3.

### 2.3 Cycle index formula for $S_7^{(2)}$

Here the cycle index formula for  $S_n^{(2)}$  is derived. First the technique used to get the disjoint cycle structures of permutations in  $S_n$  when it acts on  $X^{[2]}$  is sketched.

### 2.3.1 Derivation of cycle index formula for $S_n^{[2]}$

Derivation of the cycle index polynomial for a pair group  $S_n^{(2)}$ , the group induced when the symmetric group  $S_n$  acts on unordered pair from the set  $X = \{1, 2, \dots, n\}$ , appears in Harary, [1955]. This polynomial has been used extensively in enumerating various types of graphs. Let  $(G, X)$  be a finite permutation group and we denote by  $X^{(2)}$  the set of 2-element subsets of  $X$ . If  $g$  is a permutation in  $(G, X)$  we may want to know the disjoint cycle structure of the permutation  $g'$  induced by  $g$  on  $X^{(2)}$ .

Let  $mon(g) = t_1^{\alpha_1} t_2^{\alpha_2} \dots t_n^{\alpha_n}$ , our aim is to find  $mon(g')$  from which the disjoint cycle structure of  $g'$  can straight forwardly be obtained. To do this there are two separate contributions from  $g$  to the corresponding term of  $mon(g')$  which we need to consider.

**Case I** From pairs of points, both lying in a common cycle of  $g$ .

**Case II** From pairs of points, one in each of two different cycles of  $g$ .

It is convenient to divide the first contributions into:

**Case I (a)** Those pairs from the odd cycles and

**Case I (b)** Those from the even cycles.

**Case I(a)**

Let  $\theta = (123\dots 2m+1)$  be an odd cycle in  $g$ , then the permutation  $\theta'$  in  $(G, X^{(2)})$  induced by  $\theta$  is as follows.

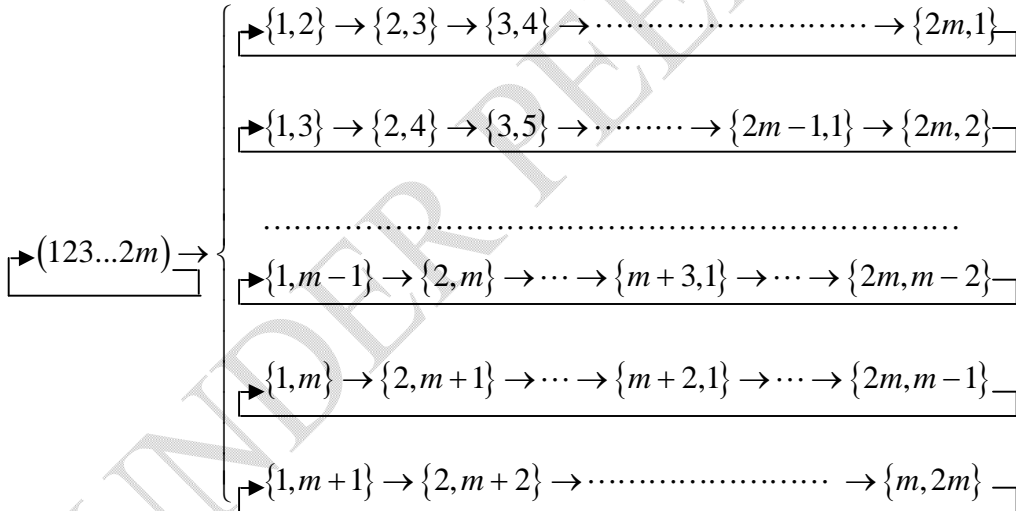

Hence  $t_{2m+1} \rightarrow s_{2m+1}^m$ .

So if we have  $\alpha_{2m+1}$  cycles of length  $2m+1$  in  $g$ , the pairs of points lying in common cycles contribute:

$$t_{2m+1}^{\alpha_{2m+1}} \rightarrow s_{2m+1}^{m\alpha_{2m+1}} \quad (1)$$

for odd cycles.

**Case I(b)** If  $\theta = (123\dots 2m)$ , then we get  $\theta'$  as follows

Hence  $t_{2m} \rightarrow s_m s_{2m}^{m-1}$

So if  $\alpha_{2m}$  is the number of cycles of length  $2m$  in  $g$ , the pairs of points lying in common cycles contribute:

$$t_{2m}^{\alpha_{2m}} \rightarrow (s_m^1 s_{2m}^{m-1})^{\alpha_{2m}} \quad (2)$$

## Case II

Consider two distinct cycles of length  $a$  and  $b$  in  $(G, X)$ . If  $x$  belongs to an  $a$ -cycle  $\theta_a$  of  $g$  and  $y$  belongs to a  $b$ -cycle  $\theta_b$  of  $g$ , then the least positive integer  $\beta$ , for which  $g^\beta x = x$  and also  $g^\beta y = y$  is  $l(a, b)$ , the least common multiple of  $a$  and  $b$ . So the element  $\{x, y\}$  belongs to an  $l(a, b)$  cycle of  $g'$ . The number of such  $l(a, b)$ -cycles contributed by  $g$  on  $\theta_a \times \theta_b$  to  $g'$  is  $\frac{ab}{l(a, b)} = d(a, b)$ , the  $gcd$  of  $a$  and  $b$ .

In particular when  $a = b = m$ , the contribution by  $g$  on  $\theta_a \times \theta_b$  to  $g'$  is  $m$  cycles of length  $m$ .

Thus when  $a \neq b$  we have

$$t_a^{\alpha_a} t_b^{\alpha_b} \rightarrow s_{l(a, b)}^{\alpha_a \alpha_b d(a, b)} \quad (3)$$

and when  $a = b = m$

$$t_m^{\alpha_m} \rightarrow s_m^{m \binom{\alpha_m}{2}} \quad (4)$$

Now we simply need to multiply the right-sides of (1) – (4) over all applicable cases. Collecting the like terms and simplifying gives  $mon(g')$  and hence the disjoint cycle structure of  $g'$ .

And thus the cycle index of  $S_n^{(2)}$  is

$$Z(S_n^{(2)}) = \frac{1}{n!} \sum_{\alpha} \frac{n!}{\prod_{m=1}^n \alpha_m! m^{\alpha_m}} \prod_{m=1}^{\lfloor n/2 \rfloor} (s_m s_{2m}^{m-1})^{\alpha_{2m}}$$

$$\prod_{m=0}^{\lfloor (n-1)/2 \rfloor} s_{2m+1}^{m \alpha_{2m+1}} \prod_{m=1}^{\lfloor n/2 \rfloor} s_m^{m \binom{\alpha_m}{2}} \prod_{1 \leq a < b < n-1} s_{l(a, b)}^{d(a, b) \alpha_a \alpha_b}$$

### 2.3.2 Cycle index of the pair group $S_7^{[2]}$

The results in Section 2.3.1 are used to derive the cycle index formula for  $S_n^{(2)}$ .

We now use the results in the previous section to derive the cycle index formula for  $S_7^{(2)}$ .

**Table 3** Permutation  $S_7$  and monomial contributions to  $S_7^{(2)}$

| Permutations $S_7$ | Monomial        | Number of permutations | Monomial contributions to $S_7^{(2)}$ |
|--------------------|-----------------|------------------------|---------------------------------------|
| I                  | $t_1^7$         | 1                      | $s_1^{21}$                            |
| (ab)               | $t_1^5 t_2$     | 21                     | $s_1^{11} s_2^5$                      |
| (abc)              | $t_1^4 t_3$     | 70                     | $s_1^6 s_3^5$                         |
| (abcd)             | $t_1^3 t_4$     | 210                    | $s_1^3 s_2^4 s_4^4$                   |
| (abcde)            | $t_1^2 t_5$     | 504                    | $s_1^1 s_5^4$                         |
| (abcdef)           | $t_1 t_6$       | 840                    | $s_3^1 s_6^3$                         |
| (abcdefg)          | $t_7$           | 720                    | $s_7^3$                               |
| (ab)(cd)(ef)       | $t_1^3 t_2^3$   | 105                    | $s_1^3 s_2^9$                         |
| (ab)(cd)(efg)      | $t_1^2 t_3^2$   | 210                    | $s_1^2 s_2^2 s_3^1 s_6^2$             |
| (ab)(cdefg)        | $t_2 t_5$       | 504                    | $s_1^1 s_5^2 s_{10}^1$                |
| (ab)(cd)           | $t_1^3 t_2^2$   | 105                    | $s_1^5 s_2^8$                         |
| (ab)(cdef)         | $t_1 t_2 t_4$   | 630                    | $s_1 s_2^2 s_4^4$                     |
| (abc)(def)         | $t_1^2 t_3^2$   | 280                    | $s_3^7$                               |
| (ab)(cde)          | $t_1^2 t_2 t_3$ | 420                    | $s_1^2 s_2^2 s_3^3 s_6$               |
| (abc)(defg)        | $t_3 t_4$       | 420                    | $s_2 s_3 s_4 s_{12}$                  |

Thus from the second and the third columns;

$$Z(s_7) = \frac{1}{7!} \left[ t_1^7 + 21t_1^5 t_2 + 70t_1^4 t_3 + 210t_1^3 t_4 + 504t_1^2 t_5 + 840t_1 t_6 + 720t_7 + 105t_1^3 t_2^3 \right. \\ \left. + 210t_2^2 t_3 + 504t_2 t_5 + 105t_1^3 t_2^2 + 630t_1 t_2 t_4 + 280t_1 t_3^2 + 420t_2 t_3 t_1^2 + 420t_3 t_4 \right]$$

From the third and fourth columns;

$$Z\left(S_7^{(2)}\right) = \frac{1}{7!} \left[ s_1^{21} + 21s_1^{11}s_2^5 + 70s_1^6s_3^5 + 210s_1^3s_2s_4^4 + 504s_1^1s_5^4 + 840s_3^1s_6^3 + 720s_7^3 + 105s_1^3s_2^9 \right. \\ \left. + 210s_1^2s_2^2s_3^1s_6^2 + 504s_1^1s_5^2s_{10}^1 + 105s_1^5s_2^8 + 630s_1s_2^2s_4^4 + 280s_3^7 + 420s_1^2s_2^2s_3^3s_6 + 420s_2s_3s_4s_{12} \right]$$

### 2.3.3 Counting series for unlabelled graph with 7 vertices

Now by Theorem 1.8 and the formula for  $Z\left(S_7^{(2)}\right)$  given in the previous section, the counting series for unlabelled graph with 7 vertices is given by

$$Z\left(S_7^{(2)}, 1+x\right) = \frac{1}{7!} \left[ (1+x)^{21} + 21(1+x)^{11}(1+x^2)^5 + 70(1+x)^6(1+x^3)^5 \right. \\ \left. + 210(1+x)^3(1+x^2)(1+x^4)^4 + 504(1+x)(1+x^5)^4 + 840(1+x^3)(1+x^6)^3 \right. \\ \left. + 720(1+x^7)^3 + 105(1+x^3)(1+x^2)^9 + 210(1+x^2)^2(1+x)^2(1+x^3)(1+x^6)^2 \right. \\ \left. + 504(1+x)(1+x^5)^2(1+x^{10}) + 105(1+x)^5(1+x^2)^8 + 630(1+x)(1+x^2)^2(1+x^4)^4 \right. \\ \left. + 280(1+x^3)^7 + 420(1+x)(1+x^2)^2(1+x^3)^3(1+x^6) \right. \\ \left. + 420(1+x^2)(1+x^3)(1+x^4)(1+x^{12}) \right] \\ = \frac{1}{5040} \left[ 5040 + 5040x + 10080x^2 + 25200x^3 + 50400x^4 + 105840x^5 + 206640x^6 + 327600x^7 \right. \\ \left. + 488880x^8 + 660240x^9 + 745920x^{10} + 745920x^{11} + 660240x^{12} + 488880x^{13} + 327600x^{14} \right. \\ \left. + 206640x^{15} + 105840x^{16} + 50400x^{17} + 25200x^{18} + 10080x^{19} + 5040x^{20} + 5040x^{21} \right] \\ = 1 + x + 2x^2 + 5x^3 + 10x^4 + 21x^5 + 41x^6 + 65x^7 + 97x^8 + 131x^9 + 148x^{10} \\ + 148x^{11} + 131x^{12} + 97x^{13} + 65x^{14} + 41x^{15} + 21x^{16} \\ + 10x^{17} + 5x^{18} + 2x^{19} + x^{20} + x^{21}$$

## 3.0 CONCLUSIONS

In this paper some properties of the action of  $S_7$  acting on unordered pairs were investigated; it was shown that  $S_7$  act transitively, primitively but not doubly transitively on unordered pairs. The rank of  $S_7$  when it acts on unordered pair was found to be 3, same as that obtained by Higmann (1964). Again the cycle index of the pair group  $S_7^{(2)}$  were obtained. The counting

series for unlabelled graph with seven vertices were computed; it was proved that there are 1044 non – isomorphic graphs; same as those obtained by Harary, (1969).

Having investigated some properties of symmetric group  $S_7$  acting on unordered pairs and constructing suborbital graphs corresponding to the action of  $S_7$  on  $X^{[2]} \times X^{[2]}$ . This work can be extended by investigating some properties of General Linear groups acting on its cosets
