

Editor's Comment:

The editorial decision of the manuscript entitled "Possible Steroid-Responsive Encephalopathy Associated With Autoimmune Thyroiditis (Sreat) In A Patient With Impaired Consciousness". The adjustments were made appropriately by the authors after peer review.

My main consideration is that figures 1 and 2 are not adequate and would need to be modified. I suggest that figures have a caption and the EEG montage must necessarily be visible in the figures. Furthermore, figure 2 has a compressed trace (probably at a speed of 15mm/sec), and this should be described in the caption.

I suggest, therefore, a minor revision with these adjustments, before the final decision.
