

**Influence of Panchagavya on Growth, Yield and Quality parameters of Bitter gourd (*Momordica charantia* L.)**

**ABSTRACT**

An experiment entitled **Influence of Panchagavya on Growth, Yield and Quality Parameters of Bitter Gourd (*Momordica charantia* L.)** was conducted at Horticulture Research Field, Department of Horticulture, Naini Agricultural Institute, Sam Higginbottom University of Agriculture, Technology and Sciences, Prayagraj during July-October, 2022 on bitter gourd. Experiment was laid out in Factorial Randomized Block Design with three replications with twelve treatment combinations. The experiment consisted of two factors. Factor 1: Hybrids as TMBI-1304, TMBI-1305 and Factor 2: Different concentrations of Panchagavya P<sub>0</sub>: Control (water spray), P<sub>1</sub>: 1% spray of Panchagavya, P<sub>2</sub>: 2% spray of Panchagavya, P<sub>3</sub>: 3% spray of Panchagavya, P<sub>4</sub>: 4% spray of Panchagavya, P<sub>5</sub>: 5% spray of Panchagavya. The results revealed that hybrid TMBI-1304 resulted superior with 5% spray in Vine length (140.50cm), Appearance of first male flower (33.11), Appearance of first female flower (35.11), Days to 50% flowering (36.15), Days to 1<sup>st</sup> harvest (49.77), Number of fruits per plant (41.55), Length of fruit (14.34cm) Average fruit weight (153.66g), Girth of fruit (17.67cm), Average fruit yield per plant (56.76), TSS (4.17), Ascorbic acid (2.05).

**Key words-** Panchagavya, FRBD, Growth, Yield, and Quality.

**1.INTRODUCTION**

Bitter gourd (*Momordica charantia* L.), is an important vegetable crop and is grown for its immature tuberculate fruits which have a unique bitter taste. The somatic chromosome number of *Momordica charantia* is  $2n=2x=22$ . It belongs to the family "Cucurbitaceae". Fruits are considered to be a rich source of vitamins and minerals and 88mg vitamin C per 100g. Bitter gourd is a green-skinned vegetable with white to

translucent flesh and a taste that fits its name. Unless you grew up with bitter gourd as part of your regular diet, it might take you a while to warm up to the bitter flavour. *Momordica charantia* likely originated in eastern India or southern China. It favours hot and humid climates with plenty of sunshine and regular water access. Today, you can find bitter gourd growing in fields across Asia, though it has also become popular in the Caribbean and South America. It has the benefit of reducing the

**Comment [u1]:** To avoid the repetition of with the sentence can be modified like Experiment was laid out in factorial randomized block design with twelve treatment combinations and replicated thrice

**Comment [u2]:** Sentence can be modified to sound good

**Comment [u3]:** Elaborate it or add some other key words that is unique to your experiment

**Comment [u4]:** And it contains 88 mg vitamin C per 100 g

diabetes mellitus by lowering the sugar levels in blood because of presence of three different groups of constituents. They are steroidal saponins known as charantin, insulin, like peptides and alkaloids.

Panchagavya is a term used in Ayurveda fermented product made from five ingredients obtained from cow such as milk, urine, dung, curd and butter (Amalraj *et al.*2011). Role of foliar applied panchagavya in production of many plantations crops has been well documented in India (Selvaraj, 2003). Panchagavya is a popular foliar nutrition prepared by organic growers of Tamil Nadu as an indigenous material and used widely for agricultural and horticultural crops (Swaminathan *et al.* 2007). Panchagavya was prepared following the procedures outlined by Selvaraj *et al.* (2006). It contained fresh cow dung 7 kg, cow urine 10 L, cow milk 3 L, curd 2 L, ghee 1 Kg, water 10 L, tender coconut water 3 L, Jaggery 3 kg and well ripened banana 12 number. Cow dung and ghee were mixed in an 80 L plastic container and stirred thoroughly both in morning and evening hours and kept aside for 3 days. After 3 days cow urine and water added to the mixture and kept for 15 days mixing twice every day. After 15 days the rest of the materials were added. The panchagavya was ready in 30 days after proper sieving through a fine cloth (Sarkar *et al.*, 2014). The chemical composition of Panchagavya is pH :5.45, ECdsm2 :10.22, Total N :229, Total P :209, Total K :232

Sodium :90 Calcium :25 IAA :8.5, GA (ppm):3.5. Panchagavya plays an important role in quality of fruits and vegetables. It is used as a foliar spray, soil application along with irrigation as well as seed treatment. Panchagavya acts as an excellent growth promoter and immunity booster for plants. It is abundant in beneficial microbial loads and attests fertilizers that have miraculous effects on plants which enhance the biological and metabolic efficiency of crops. In addition Panchagavya also includes growth hormones, Auxins and Gibberellins which have advantageous effect on crops and acts as tonic for enhancing soil quality production. Panchagavya has played a significant role in providing resistance to pests and diseases, resulting in increased overall yields. The demand of bitter gourd is increasing day by day and is one of the most important vegetable crop for farmers. As the world is growing towards organic farming so, one of the most important organic product used is Panchagavya which plays a role in producing larger leaves, denser canopy, lateral shoots which results in higher yield. Today's production includes the use of chemical fertilizers, pesticides and growth regulators to enhance crop yields. However, over-dependence on chemical fertilizers adversely affects the soil, the environment and also humans. Today's organic bitter melon farming relies on bulky organic fertilizers such as manure, vermicompost and in some cases poultry manure. As a result, farmers are not

**Comment [u5]:** Sentence can be modified as there is too many 'of' in a single sentence. For example : Due to the existence of three separate constituent groups, it offers the advantage of lowering blood sugar levels, hence minimising the risk of developing diabetes mellitus.

**Comment [u6]:** Is it needed to add the preparation procedure in introduction .? whether it is wrongly placed here instead of materials and methods

getting the desired yield from organic bitter gourd cultivation. Several studies show that the application of liquid organic fertilizers together with conventional bulky organic fertilizers can improve fruit yield in addition to better quality and preservation. Therefore the present investigation was executed to study the mean performance of different concentration of Panchagavya and interaction effect between hybrids and different concentrations of Panchagavya on growth, yield and quality parameters under Prayagraj Agro-climatic conditions

## 2. MATERIALS AND METHODS

The investigation was carried out at the Horticulture Research Field, Department of Horticulture, Naini Agricultural Institute, Sam Higginbottom University of Agriculture, Technology & Sciences, Prayagraj (U.P.) during July-October, 2022. The experiment was conducted in Factorial Randomized Block Design with 12 treatments in three replications viz. T<sub>0</sub>: V<sub>1</sub>P<sub>0</sub> (TMBI-1305)+ Control, T<sub>1</sub>: V<sub>1</sub>P<sub>1</sub>(TMBI-1305+ 1% Spray of Panchagavya), T<sub>2</sub>: V<sub>1</sub>P<sub>2</sub> (TMBI-1305+ 2% Spray of Panchagavya), T<sub>3</sub>: V<sub>1</sub>P<sub>3</sub> (TMBI-1305+ 3% Spray of Panchagavya), T<sub>4</sub>: V<sub>1</sub>P<sub>4</sub> (TMBI-1305+ 4% Spray of Panchagavya), T<sub>5</sub>: V<sub>2</sub>P<sub>5</sub> (TMBI-1305+ 5% Spray of Panchagavya) , T<sub>6</sub>: V<sub>2</sub>P<sub>0</sub>(Tmbi-1304+Control), T<sub>7</sub>: V<sub>2</sub>P<sub>1</sub> (TMBI-1304+ 1% Spray of Panchagavya), T<sub>8</sub>: V<sub>2</sub>P<sub>2</sub> (TMBI-1304+ 2% Spray of Panchagavya), T<sub>9</sub>: V<sub>2</sub>P<sub>3</sub> (TMBI-1304+ 3% Spray of Panchagavya)

T<sub>10</sub>: V<sub>2</sub>P<sub>4</sub> (TMBI-1304+ 4% Spray of Panchagavya) T<sub>11</sub>: V<sub>2</sub>P<sub>5</sub>(TMBI-1304+ 5% Spray of Panchagavya) with two Bitter gourd hybrids TMBI-1305 and TMBI-1304 (Trimurti plant science Pvt. Ltd. Crop was planted with the spacing of 150×75 cm with the addition of NPK as basal dose along with spraying of Panchagavya which was done at 15, 30 and 45 Days after emergence of two true leaf stage. The data was recorded for the following parameters viz Vine length(cm), appearance of first male flower, appearance of first female flower, appearance of 50% flowering, days to first harvest, number of fruits per plant, length of fruit(cm), average fruit weight(g), girth of fruit(cm), average yield per plant(Kg), total yield(t/ha), TSS(°Brix) and ascorbic acid(mg/100g).

## 3. RESULTS AND DISCUSSION:

### 3.1 Growth parameters

#### 3.1.1 Vine length

Vine length varies significantly between different Hybrids. Longer vine length at 90days after sowing was found in variety TMBI-1304 (137.84cm) in Table no.1. Due to the different concentrations of Panchagavya the longer vine length was recorded in 5% spray of Panchagavya (137.53 cm) in Table 2. Interaction data revealed TMBI-1304 + T<sub>11</sub> 5% Spray of Panchagavya was recorded with longer vine length (140.50cm) in Table 3. Significant and longer vine length was recorded with the application of 5% spray of Panchagavya which may be due to presence

**Comment [u7]:** Whether total urea applied as basal dose how much is the quantity of fertilizer applied  
Is there any addition of farm yard manure  
What is the n p k status in soil before and after the experiment

**Comment [u8]:** Spelling correction  
Harvest

**Comment [u9]:** Mention the reference and method used for calculation of tss and ascorbic acid

of auxin in Panchagavya that leads to epical dominance and GA<sub>3</sub> in Panchagavya that leads to cell elongation and cell division resulting in increased vine length.

### 3.2 Earliness Parameter

#### 3.2.1 Influence of Panchagavya on Appearance of first male flower

Appearance of 1<sup>st</sup> male flower varies significantly between different Hybrids. Early male flower initiation was found in variety TMBI-1304 (34.32) in Table 1. Due to the different concentrations of Panchagavya the earliest male flower was recorded in 5% spray of Panchagavya (34.22) in Table 2. Interaction data revealed that TMBI-1304 + T<sub>11</sub> 5% spray of Panchagavya was recorded with earliest male flower initiation (33.11) in Table 3. Significant and early male flower initiation was recorded with application of 5% spray of Panchagavya which may be due to presence of GA<sub>3</sub> and N, P, K.

#### 3.2.2 Influence of Panchagavya on Appearance of first Female flower

Appearance of 1<sup>st</sup> Female flower varies significantly between different Hybrids. Early female flower initiation was found in variety TMBI-1304 (36.32) in Table 1. Due to the different concentrations of Panchagavya the earliest female flower was recorded in 5% spray (36.22) in Table 2. Interaction data revealed that TMBI-1304 + T<sub>11</sub> 5% Spray of Panchagavya was recorded with earliest female flower initiation (35.10) in table 3. Significant and early female flower initiation

was recorded with application of 5% spray of Panchagavya which may be due to presence of GA<sub>3</sub> and N, P, K.

#### 3.2.3 Influence of Panchagavya on Appearance of 50% flowering

Days to 50% flowering varies significantly between different Hybrids. Least number of days taken for 50% flowering was found in hybrid TMBI-1304 (37.47) in table 1. Due to different concentrations least number of days to 50% flowering was found in 5% spray of Panchagavya(37.25) in table 2. Interaction data revealed that TMBI-1304 + T<sub>11</sub> 5% Spray of Panchagavya was recorded with earliest flower initiation (36.15) in table 3. Significant and early 50% flowering was recorded with application of 5% spray of Panchagavya which may be positively affected by Panchagavya due to cell differentiation and flower bud formation activity of cytokinin present in Panchagavya.

### 3.3 Yield Parameters

#### 3.3.1 Influence of Panchagavya on Days to first harvest

Days to first harvest varies significantly between different Hybrids. Earliest days to harvest was found in variety TMBI- 1304 (51.25) in table 1. The earliest number of fruits was found in treatment 5% Spray of Panchagavya (51.16) in table 2. Interaction data revealed that early number of days to first harvest was recorded in TMBI-1304+ 5% spray of Panchagavya (49.77) in table 3. Significant and early number of days to first

Comment [u10]: reference

Comment [u11]: Suggestion the results can be discussed thoroughly with supporting researches and scientific evidences. Add appropriate references in results than just quoting T11 is superior.

harvest was recorded with application of 5% spray of Panchagavya which might have increased metabolic activity leading to active translocation of nutrients to develop fruits which result in early maturity of fruits.

### **3.3.2 Influence of Panchagavya on Number of fruits per plant**

Number of fruits per plant varies significantly between different Hybrids. Maximum number of Bitter Gourd fruits per plant was found in variety TMBI- 1304 (39.22) in table no. 1. The maximum number of Bitter gourd fruits per plant was found in treatment 5% Spray (38.83) in table no. 2. Interaction data revealed that maximum number of Bitter gourd fruits per plant was recorded in TMBI-1304 + 5% spray of Panchagavya (41.55) in table no.3.

Significant and more number of fruits per plant was recorded with 5% spray of Panchagavya which might be due to presence of auxin and kinetin in Panchagavya which upon applying on foliar spray favoured the plants to produce more number of fruits per plant.

### **3.3.3 Influence of Panchagavya on Length of fruit (cm)**

Fruit length varies significantly between different Hybrids. Maximum fruit length was found in variety TMBI-1304 (12.34 cm) in table no.1. Maximum length of fruit was recorded in 5% spray (12.70) in table no 2. Interaction data revealed in TMBI-1304+ 5%

spray is recorded with maximum fruit length (14.34) in table no 3. Significant and maximum length of fruit was recorded with application of 5% spray of Panchagavya which might be due to growth hormones and macronutrients that have affected treated plants along with increase photosynthesis causing the cell elongation and division.

### **3.3.4 Influence of Panchagavya on Average weight of fruit (g)**

Fruit weight varies significantly between different Hybrids. Heavier fruit weight was found in variety TMBI- 1304(143.58g) in table no 1. Due to different concentrations heavier fruit weight was recorded 5% spray (117.66g) in table no 2. The interaction effect on average weight of fruit due to Hybrids and treatments was found significant. Interaction data revealed in TMBI-1304+ 5% spray is recorded with maximum fruit weight (153.66g) in table no 3. Significant and heavier fruits was recorded with application of 5% spray of Panchagavya which may be due to the metabolic activity, leading to active translocation of more amount of carbohydrates to developing fruits and utilization of NPK in Panchagavya.

### **3.3.5 Influence of Panchagavya on girth of fruit (cm)**

Fruit girth varies significantly between different Hybrids. Maximum fruit girth was found in variety TMBI- 1304(16.55cm) in table no 1. Average girth of fruit was significant due to treatments. Maximum fruit

**Comment [u12]:** Revealed that

girth was recorded 5% spray (16.72cm) in table no 2. The interaction effect on average girth of fruit due to Hybrids and treatments was found significant. Interaction data revealed in TMBI-1304+ 5% spray is recorded with maximum fruit girth (17.67) in table no 3. Significant and higher girth of fruit was recorded with application of 5% spray of Panchagavya which may be due to NPK along with combination with cytokinin increases efficiency of chlorophyll pigment, photosynthates and increases allocation in the economic part which results in higher girth.

### **3.3.6. Influence of Panchagavya on Average Fruit yield per plant**

Average number of fruits per plant varies significantly between different Hybrids. Maximum number of fruits per plant was found in variety TMBI-1304 (5,667.07) in table no 1. Due to different concentration maximum number of fruits per plant was found in treatment 5% Spray (4,667.16) in table no 2. The interaction effect on average number of fruits per plant due to Hybrids and treatments was found significant. Interaction data revealed that maximum number of fruits per plant was recorded in TMBI-1304 + 5% spray (6,385.55) in table no 3. Significant and maximum fruit yield was recorded with application of 5% spray of Panchagavya which might be due to microbes present in Panchagavya that produces growth hormones which may cause increase in weight of fruit, number of fruits/plant, cell division and cell

elongation by translocation of more amount of carbohydrates to the developing fruits.

### **3.3.7 Influence of Panchagavya on Total yield (t/ha)**

Fruit yield tons per hectare varies statistically between different Hybrids. Maximum fruit yield tons per hectare was found in variety TMBI-1304(50.37) in table no 1. Due to the different concentrations of Panchagavya the maximum fruit yield tons per hectare was found in treatment 5% spray of Panchagavya (41.48) in table no 2. The interaction effect on average fruit yield tons per hectare due to Hybrids and treatments was found maximum in treatment TMBI-1304,5% spray (56.76) in table no 3.

## **3.4. Quality Parameters**

### **3.4.1. Influence of Panchagavya on TSS<sup>0</sup> Brix**

TSS varies statistically between different Hybrids. Maximum TSS was found in variety TMBI-1304(3.74) in table no 1. Due to the different concentrations of Panchagavya the maximum TSS was found in treatment 5% spray of Panchagavya (3.805) in table no 2. The interaction effect on TSS due to Hybrids and treatments was found maximum in treatment TMBI-1304,5% spray (4.17) in table no 3. Significant and maximum TSS was observed with application of 5% spray of Panchagavya which might be due to quick metabolic transformation of starch and pectin into soluble compounds and rapid

translocation of sugars from leaves to developing fruits.

### 3.4.2. Influence of Panchagavya on Ascorbic Acid (mg/100g)

Vitamin-C varies statistically between different Hybrids. Maximum content of Vitamin-C was found in variety TMBI-1304(1.79) in table no 1. Due to the different concentrations of Panchagavya the maximum content of Vitamin-C was found in treatment 5% spray (1.937) in table no 2. The interaction effect of Vitamin -C due to Hybrids and treatments was found maximum in treatment TMBI-1304,5% spray (2.05) in table no 3. Significant and maximum Vitamin C was observed with application of 5% spray of Panchagavya which might be due to quick metabolic transformation of starch and pectin into soluble compounds and rapid translocation of sugars from leaves to developing fruits.

## 4.CONCLUSION

From the present investigation, it is concluded that the influence of Panchagavya with different treatment combinations rendered their significant effect on, growth yield and quality of bitter gourd. Treatment T<sub>11</sub> (TMBI-1304+ 5% spray of Panchagavya) recorded best in vine length, days to first appearance of male flowers, first appearance of female flowers, Appearance of 50% pistillate flowers, days to first harvest, average fruit weight (g), length of fruit (cm),

fruit Girth (cm), number of fruits per plant, average yield per plant (g), yield (t/ha), TSS (°Brix) and Ascorbic Acid (mg/100g
