

Editor's Comment:

The study design and sample are from 2011, which means that after some worldwide events (e.g., COVID, etc.) something have changed and probably findings are not accurate anymore. Maybe authors could made a pre-post comparison with 2011 and 2023/24...

The methodology is based on descriptive statistics only... a pre-post comparison will possibly advance with new data and more useful to be used nowadays.

For that reason, the decision is to Reject.
