<b>Compulsory</b> REVISION comments	<b>This is a good, informative case report highlighting the rare presentation of isolated duodenal injury. The findings and outcomes are going to help the surgeons in choosing a reasonable and appropriate method of treatment when one comes across such cases in their day to day practice. However explanation as to why a non contrast CT scan of the abdomen was performed in a hemodynamically unstable patient when plain radiographs could reveal the same findings of pneumoperitoneum and can be done bedside has not been given thereby defying the protocols of ATLS in the treatment of a patient of trauma.
