

**Editor's Comment:**

There are significant issues with this manuscript.

1. The experimental location is not well documented – should have a description of locale with GPS coordinates, source of pollutants, distances between sampling sites etc.
2. **Chemical oxygen demand (APHA 5220C)**
3. – something missing in the first line
4. Did the Norkram medium really have 20,00gm per liter of sucrose? Seems past solubility point to me.
5. were amended with 16.1, 8.1, 4.0 and 2.0mg/dl – with what?
6. I am not clear what pre and post-remediation samples refer to? Bacterial. Fungal treatments? Both? Something else?

Some problems still with language:  
result primarily from local irritation.? After injection ingestion?

There is a possible contribution here but this version is not appropriate for publication.
