

Editor's Comment:

I carefully analyzed the reviewers' recommendations and the final paper.

The reviewers made some recommendations for improving the paper. However, the current paper lacks the necessary accuracy of a scientific paper.

In my opinion, the paper can be accepted for publication only after making the following improvements:

- remove this @ from the paper,
- present in the material and method the doses used for pesticides and the determination methods with references (if these are not methods invented by the authors),
- use the unitary way of presenting the units of measure, currently you use 2 different methods: g ha⁻¹ and g/ha,
- present in footnotes all the abbreviations used in graphics and tables,
- develop 3-4 new conclusions, including the perspective of new research,
- add discussions of the results and another 10-15 new references from the last 5 years.

These would be my recommendations.
