

### **Editor's Comment:**

All the recommendations suggested by Dr. Mitra Karbasi. Kheir are valuable and definitely taken into account. In addition to that I have the following suggestions:

1. The sentence formation in general could be made more cognizant to convey the meaning in the desired sense. Example: First and third sentence in aims and purposes and also "the real one" "the term in material and methods should be changed.
2. The version of SPSS software was not specified. Arithmetic mistake in table 1, the arithmetic values of given in table 2 does not match with the description given verbally. Example: Table 2 says 72,62 whereas the description says 72.62%.
3. In the data regarding usage of Bulgaria made units and imported ones there is no table figure or graph to support it.
4. The discussion part has to be further made meaningful by comparing the results of studies done in similar terms and content
5. The first 2 references does not have date of issue so I was not able to cross check for the content
6. The forth reference does not match with the content specified in the article

Finally in my opinion my suggestion is to re-write the methods and methodology and discussion part of the article with more clarity and unambiguity. The result should have more articles for justification.
