Short Research Article

Okra Supply Chain: A Case Study of Vadodara City of Gujarat

ABSTRACT

Aims: This study conduct based on following objectives:- To identify different marketing channels of okra in Vadodara city, To estimate price spread of okra crop, To identify problems faced by producers and intermediaries

Study design: To accomplish study objectives primary data collected from 50 farmers of Vadodara city. Secondary data were collected from different Private and Government publications, Review Paper, Literature, Journals.

Place and Duration of Study: Padra, Karjan, Waghodia, Aklav, and Savli talukas are selected in Vadodara district for study. the study was conducted for 45 days.

Methodology: Randomly selected the Farmer, Wholesalers, Retailers and Private companies from the above area. The descriptive research design was used for the research. Non-probability sampling method and convenience sampling technique was used.

Results: In channel I very small proportion of the agricultural commodities which move directly from Producers to consumers. Channel II is the most common supply chain for okra during the period of June and July. Channel III & IV both are working at rural level. Channel I has the best marketing efficiency out of these six marketing channels, but it is not realistic to sell all produce through this channel. the most common problem faced by farmers are lower price which can be solved by collectivism and contract farming.

Conclusion: Out of these six marketing channels, marketing efficiency is highest in channel V because of less no. of intermediaries. So it is concluded that lesser the number of intermediaries higher will be the marketing efficiency.

Key Word – Supply Chain, Okra, Marketing Efficiency, Price Spread

1. INTRODUCTION

Due to India's diverse geography, there is a variety of fresh produce available. India produces the second-most fruits and vegetables worldwide, after China. In 2019–20, India produced 99.07 million metric tonnes of fruits and 191.77 million metric tonnes of vegetables on 10.35 million hectares of land. Fruits were cultivated on 6.66 million hectares of land. Okra is produced on 10548 thousand tonnes on 2531 thousand hectares (ha) of land. The top developing nations for produce okra include India, Nigeria, Mali, Sudan, Pakistan, Ghana, Egypt, Benin, Saudi Arabia, Mexico, and Cameroon. Nigeria is the country with the second-highest production after India. India have the highest productivity (12.17 tons/ha), followed by Mali (11.71 tons/ha). Gujarat is the leading okra-producing state which has a production of around 1,019 thousand tons followed by West Bengal (893 thousand tons), and Bihar (794 thousand tons). Okra is harvested throughout the year in Gujarat. Okra is farmed in Gujarat over an area of 85.15 thousand hectares (ha), with a total annual yield of 1019.42 thousand tonnes. Gujarat's main okra-producing regions are Surat, Vadodara, and Junagarh. Mangrol, Umarwada, Mandvi, Vyara, Valod, Mahuva, Palsana, Kamrej, Olpad, Nizer, Vadoli, and

Unal are significant okra catchment areas in Surat. Major okra catchment areas in Vadodara include Padra, Karjan, Waghodia, Aklav, and Savli etc. (MoA&FW 2020-2021)

The following objectives motivated for study's conduct:

- To identify different marketing channels of okra in Vadodara city
- To estimate price spread of okra crop
- To identify problems faced by producers and intermediaries

2. MATERIAL AND METHODS

To accomplish these objectives primary data collected from 50 farmers,15 wholesaler,15 retailer,6 commission agent,6 trader,3 private companies of Vadodara city. Secondary data were collected from different Private and Government publications, Review Paper, Literature, Journals. The descriptive research design was used for the research. The convenience sampling technique and the non-probability sampling method were utilised. the study was conducted for 45 days.

2.1 Analytical Tools

Objective 2: To estimate price spread of okra crop

The Acharya approach was applied to determine the marketing efficiency of okra crop . The following formula was used to calculate the marketing expense:

C = Cf + Cm1+ Cm2+ Cm3+…….. + Cmi

were, C = total expense for promoting the commodity

Cf = cost bear by the producer after the produce leaves the farm and before it is sold

Cmi = cost bear by the middleman's services during the purchase and selling of the product

Marketing Efficiency = $\frac{NP_F}{MC+MM}$

were, NPF = Net cash received by farmer

MC = Total marketing expense

MM = total margin for marketing

Objective 3: To identify problems faced by producers and intermediaries

Through weighted average mean analysis is done,

weighted average mean = Total cumulative score/ Total no of respondent

3. RESULTS AND DISCUSSION

3.1 Results

Marketing Channels (MC): Agriculture goods are transported from producers to consumers via some channels is called marketing channels.

Table 1. Marketing channels of okra in Vadodara

Channel No.	Marketing Channels
MC* 1	Farmer – Consumer
MC 2	Farmer – APMC – Wholesaler – Retailer – Consumer
MC 3	Farmer – Commission Agent – Wholesaler – Retailer – Consumer
MC 4	Farmer – Commission Agent - APMC – Wholesaler – Retailer – Consumer
MC 5	Farmer – Collection Centre – Private Companies- Consumer
MC 6	Farmer – Vendor – Private Companies - Consumer

**MC = Marketing Channels*

Marketing Efficiency

Table 2. Marketing costs, margins and price spread of okra for channel I, II, III,IV

Marketing cost (Rs/qtl)	Channel I	Channel II	Channel III	Channel IV
Net price received by the producer	3600	1900	2060	2200
a) Operational Cost	900	900	900	1200
b) Commission	0	0	0	0
c) Post Harvest Loss	1000	700	740	900
Total (a to c)	1900	1600	1640	2100
Commission agent Price	0	3500	3700	0

Cost incurred by local agent				
a) Operational Cost	0	0	100	0
b) Transportation Cost	0	0	50	0
c) Loss during handling	0	0	222	0
Total (a to c)	0	0	372	0
Commission agent Margin	0	300	928	0
Trader Price	0	3800	0	0
Cost incurred by Trader				
a) Operational Cost	0	80	0	0
b) Transportation Cost	0	70	0	0
c) Loss during handling	0	55	0	0
Total (a to c)	0	205	0	0
Trader Margin	0	495	0	0
APMC Price	0	4500	5000	4300
Wholesaler Price	0	4500	5000	4300
Cost Incurred by Wholesaler				
a) Operational Cost	0	50	25	100
b) APMC Fees	0	225	250	215
c) Transportation Cost	0	30	20	50
d) Loss during handling	0	45	20	100
Total (a to d)	0	350	315	465
Wholesaler Margin	0	150	185	785
Retailer Price	0	5000	5500	5550
Cost Incurred by retailer				
a) Operational Cost	0	40	40	40
b) Transportation Cost	0	150	150	150
c) Loss during handling	0	250	195	170
Total (a to c)	0	440	385	360
Retailer Margin	0	560	315	590
Consumer price	5500	6000	6200	6500
Total marketing cost	1900	2595	2712	2925

c) loading and unloading	30	0
d) Loss during handling	240	165
Total (a to d)	400	315
Private Companies D.C. Vadodara margin	1110	485
Consumer Price	6300	6300
Total marketing cost	2640	2795
Total marketing margin	1110	1005
Price Spread	3750	3800
Producers Share in Consumer's Rupee	40.47 %	39.68 %
Marketing efficiency (Acharya's Method)	68.00 %	65.78 %

Problems Faced by Producers and Intermediaries

Table 4. Problems faced by the farmers

Problem	Rank
Lower price	1
Location of selling unit far away	2
Inadequate transportation facility	3
Large No. of Intermediaries	4
Lack of storage/ cold storage facility	5
Delay in payment and sale proceeds	6
Lack of grading facility	7
Lack of market information	8
Lack of contracting agencies	9

Table 5. Problems faced by Wholesalers

Problem	Rank
Lack of grading facility	1
Delay in payment and sale proceeds	2
Lack of storage/ cold storage facility	3
Large No. of Intermediaries	3
Perishability	3
Lack of market information	4
Lower price	4

Table 6. Problems faced by Retailers

Problem	Rank
Large No. of Intermediaries	1
Lack of grading facility	2
Lower price	3
Perishability	3
Delay in payment and sale proceeds	4
Lack of storage/ cold storage facility	5
Lack of market information	6

Table 7. Problems faced by private companies

Problem	Rank
Delay in payment and sale proceeds	1
Lack of storage/ cold storage facility	2
Inadequate transportation facility	2
Lack of market information	3
Lack of grading facility	3
Lower price	3

3.2 Discussion

3.2.1 Marketing Channels

In channel I very small proportion of the agricultural commodities which move directly from Producers to consumers. Channel II is the most common supply chain for okra during the period of June and July. Channel III & IV both are working at rural level. In channel III the farmers sell the Okra to Commission agent at the village level. After grading the produce at the grading center located in village, the Commission agent transported and sold it to the wholesaler in Vadodara market. The wholesaler sold it to the retailer and last okra reaches to final consumer. In channel IV the farmers sold the Okra to Commission agent at the village level. The Commission agent transported it and sold in APMC without grading. The wholesaler purchase from APMC and after grading sold it to retailer and last okra reaches to final consumer. Bigbasket followed marketing channel V in the Vadodra area to buy continuous okra at the farm level. If okra is not accessible at the farm level, Bigbaket will use the VI channel.

3.2.2 Price Spread of Okra

Channel I has the best marketing efficiency out of these six marketing channels, but it is not realistic to sell all produce through this channel. However, channel V marketing efficiency is around 68% and is a practically feasible channel due to the lower number of intermediaries. As a result, the lower the number of middlemen, higher will be the marketing efficiency.

Marketing efficiency is inversely related to the price spread. The price spread is highest in channel IV, approximately 4300, followed by channel III and II, which are around 4140 and 4100, respectively. Around 3750 is seen in channel V.

Channel-I has the highest proportions of the producer share in consumer rupee, followed by channels-V and VI. That is about 65.45%, 40.47% and 39.68% respectively.

3.2.3 Problems Faced by Producers and Intermediaries

Problems faced by the farmers:- According to table no.4, the most common problem faced by farmers are lower price which can be solved by collectivism and contract farming.

Problems faced by Wholesalers:- According to table no.5, the most common problem faced by wholesalers are lack of grading facility which could be work out by providing infrastructure-related schemes.

Problems faced by Retailers:- According to table no.6, the most common problem faced by retailers are large no. of intermediaries it could be solved by providing general B2B platforms.

Problems faced by private companies:- According to table no.7, private companies most common problems are delays in payment and sale proceeds, which may be solved by providing early payment discounts and establishing an efficient centralized system.

3. CONCLUSION

Due to the high okra cultivation, a number of private companies have opened collecting centres around Padra and Karjan talukas. Most farmers in the Vadodara district follow chemical farming, and the majority of them cultivate the Radhika variety of okra due to its high yield and disease resistance power. Farmers in the Vadodara district have an average of four years of okra farming expertise. Out of these six marketing channels, marketing efficiency is highest in channel V because of less no. of intermediaries. So it is concluded that lesser the number of intermediaries higher will be the marketing efficiency. In Vadodara district farmers faces lower price problem which can be solved by collectivism and contract farming; wholesalers have an issue of grading facilities which could be work out by providing infrastructure-related schemes; Retailers face problems like large number of intermediaries and it could be solved by providing B2B platforms whereas private companies faces problem like delay in payment and sale proceeds which may be solved by providing early payment discount and by establishing an efficient centralized system respectively.
