

Editor's Comment:

Thank you for sending me the files corresponding to the revised version of the manuscript entitled A Digital microscopic evaluation of the induction of dentinal micro-cracks after canal preparation with rotary and reciprocating NiTi systems in vitro.

Please find in the attachment the file containing my opinion on it.

My opinion is visible inside the Table, while my explanation can be found below the Table. Unfortunately, my decision is "Rejected", because the Authors only addressed some of the recommended adjustments, without a careful consideration. An example of this lack of consideration is represented by the explanation offered by the Authors for the abbreviation "VFR", which they said represented "Variable Refrigerant Flow" (which has nothing to do with the dental field), when it actually represents "Vertical Root Fracture", as resulted from the last reference (13) and from the remarks of one of the reviewers.
