

Commodity Future Trading and Cointegration of Turmeric Markets in India

ABSTRACT:

The government has reduced its direct market intervention in order to promote private sector engagement based on market forces, farmers in an agriculture-dominated economy like India suffer not only yield risk but also pricing risk. As a result, agricultural products are now more vulnerable to market risks related to pricing and other factors. The futures market has to decide the prices of a commodity on the basis of demand and supply. It is important to know about the bi directional and unidirectional relationship between different market's prices and future and Spot markets in India, price discovery process and price forecasting in Indian agricultural commodities. Knowing about different market's price Integration will help us to know the prevailing prices in various markets and also impact of one market's price with another. It will help the farmers to know the different pricing status in different markets. The study analyses the efficiency of commodity futures of turmeric traded in NCDEX for 2016-2022 and cointegration of Nizamabad, Erode, Sangli and Cuddapah Markets of India . In agriculture, commodity futures and derivatives are essential to the process of managing price risk.

Key words: Commodity Futures, Cointegration, spot Price and Future price, Turmeric

1.INTRODUCTION:

Commodity Market is a market where commodities will be exchanged. Commodity future market is the market where an agreement or contract will be done before the trading of the commodities. It is further divided into Forward market and Future Market. Forward Market is the market where the contract is done before the transactions of the commodity but the trading happens based on the price prevails at the time of contract. Unlike Future market is the market where the contract is done before the transaction of commodities but the trading will be based on the price at the time of buying or selling the commodities. It may be a spot market or a derivatives market. In spot market commodities are bought and sold for immediate delivery, where as in derivatives market various financial instruments based on commodities are traded. Commodity futures market was very much there in earlier times in India. In fact it was one the most vibrant markets till the early 70s. But due to numerous restrictions the market could not develop further. Now that most of these restrictions have been removed, there is enormous scope for the development and growth of the commodity futures market in the country. A nation's financial market includes the commodity market as a significant component. For individuals who desire to invest in anything other than stocks, bonds, real estate, etc., the commodity market provides an alternative investment option. India is a nation where agriculture plays a significant role in the overall economy, hence price fluctuations during the harvesting season have always been of great concern to the farming community.

Commodities can be categorized into major groups like agriculture produce, metals etc.

In India, they are further broken into following categories:

1) Agriculture: Grains: Basmati Rice, Rice, Maize, Wheat. Oil And Oilseeds: Soy Seeds, Castor Oil, Castor Seeds, Soymeal, Refined Soy Oil, Crude Palm Oil, Mustard Seed, Groundnut Oil, Cottonseed,

Etc. Spices: Red Chilli, Pepper, Turmeric, Jeera and Cardamom. Pulses: Urad, Chana, Yellow Peas, Tur Dal.

2) Metals and Materials: Base Metals: Copper, Aluminum, Zinc, Nickel, Tin. Bulk Commodities: Coking Coal, Iron Ore, Steel, Bauxite.

3) Precious Metals: Silver, Gold, Platinum and Palladium.

4) Energy: Natural Gas, Crude Oil, Brent Crude, Thermal Coal.

This type of Commodity Markets were under the control of Forward Market Commission in the past . but at the time of September 2015, Forward Market Commission (FMC) was merged with (SEBI)Security Exchange Board of India and monitoring this Exchanges. For the study, the commodity exchange NCDEX is chosen Turmeric is considered for the study.

As a result, on April 1, 2003, the Government of India issued notifications allowing futures trading (apart from options trading) for a variety of agricultural commodities. India currently has four national-level commodity exchanges and 21 regional-level commodity exchanges that are authorised to trade agricultural commodities in derivatives.

TURMERIC :

India produces 78% of world Turmeric Production .

source: Spices board of India

fig . 1 Turmeric Production in different countries

Curcuma longa, the botanical name of turmeric, is a member of the zingiberaceae family and is grown in red soils at temperatures between 20 and 30 degrees. Turmeric is utilised in cosmetics, medications, and cuisine as a colour and flavouring. India, which provides 80-85% of the global population and produces 6.0 lakh MT to 7.0 lakh MT of turmeric annually, is the world's largest producer. There are about 30 varieties of turmeric and the most popular varieties in India are Alleppey finger (Kerala), Erode and Salem turmeric (Tamil Nadu), Rajapore and Sangli turmeric (Maharashtra), Nizamabad Bulb (Telangana). The country's turmeric production in 2021-22 is estimated at 13.31 lakh tonnes (lt) against 11.24 lt the year before, up by over 18 per cent.

Turmeric is produced, consumed, and exported mostly in India. Given its high curcumin content, Indian turmeric is regarded as the best on the global market. About 80% of the world's production of turmeric and 60% of its exports come from India. Haiti, Jamaica, Peru, Taiwan, Pakistan, China, and Haiti are additional top producers. A large portion of the production of turmeric is used in Asia.

Top 10 Turmeric Producing States in India		
states	Previous FY(2020-21)	Current FY(2021-22)
Telangana	3.87	3.13
Karnataka	1.33	1.31
TamilNadu	0.96	0.87
Andra Pradesh	0.71	0.73
West Bengal	0.46	0.46
Orissa	0.44	0.44
Maharastra	2.19	2.27
Mizoram	0.30	0.30
Assam	0.23	0.21
Gujarat	0.18	0.30
Others	1.13	1.02
All India	11.79	11.02

Table 1 : Top 10 Turmeric Producing States in India

The major turmeric-growing states in India are Andhra Pradesh, Telangana, Tamil Nadu, Maharashtra, Assam, Kerala, Karnataka, and Westbengal . Orissa, Tamil Nadu, and Andhra Pradesh make up the next three states in terms of land devoted to growing turmeric, each with 17%. 60 percent of India's entire production of turmeric is produced in Andhra Pradesh followed by TamilNadu (13%). The Area occupied was Andra Pradesh(40%), Orissa (17%) and TamilNadu(13%). The dried, powdered form of turmeric is a common food additive that gives food both flavour and colour. Turmeric oleoresin, which is made by extracting the pulverised spice with a solvent, is used in the production of pickles, mayonnaise, relish, non-alcoholic beverages, butter, and cheese, among other things. Alleppey Finger (Kerala) and Erode and Salem turmeric (Tamil Nadu), Rajapore and Sangli turmeric(Maharashtra) and Nizamabad Bulb (AndhraPradesh) in Tamil Nadu. Tamil Nadu, a 100kg bag of turmeric now costs more than 8 gm of gold. Erode, the world's largest producer and most important trading centre of turmeric in Asia, has seen its turmeric trading prices shoot up 30 per cent in value over the past few months.

2.REVIEW OF THE LITERATURE:

Gouri Prava Samal (2017)The paper evaluates the efficiency of Indian cotton futures prices in predicting future spot prices on the period January, 2013 to December, 2015 using Vector Auto Regression model and Granger causality tests. To check stationarity in futures and spot prices ADF test is applied. The results show that both the variables are stationary at level. The VAR model suggests that lag value of futures has more influence on spot price of cotton. The causality test has further indicated that futures markets have negligible ability to predict subsequent spot prices for cotton.

Nazlioglu et.al(2019) this study explores the dynamic link between global oil prices and 24 global agricultural commodity prices while taking relative US dollar strength fluctuations into account. For a panel of twenty-four agricultural items with monthly prices ranging from January 1980 to February 2010, we use panel cointegration and Granger causality approaches. He found that how variations in the price of oil affect the prices of agricultural commodities. Contrary to the findings of numerous studies in the literature, which claim that fluctuations in oil prices have no effect on agricultural prices, we discover compelling evidence that the price of various agricultural commodities is influenced by global oil prices.

Lokare (2007) found that although Indian commodity market is yet to achieve minimum critical liquidity in some commodities (sugar, pepper, turmeric), almost all the commodities show a evidence of co-integration between spot and future prices revealing the right direction of achieving the improved operational efficiency, though at a slower rate. Further hedging proves to be effective in respect of some commodities. However, for a few commodities, the volatility in future price has been substantially lower than the spot price indicating an inefficient utilization of information

QiuMengyuan, Ocean University of China(2015),The futures prices of Chinese agricultural products are generally followed by the Chicago commodity exchange futures prices. The objective is to find the relationship between corn futures prices in China and corn future price United States. The Johansen Co-integration test is used to test the long run co integration and found that there is a long run co integration between two variables and By comparison, the information in the corn market of America transfers faster and the U.S. corn futures market plays a leading role. This research also suggested about how to promote the development of China's corn Future Market

Sahi (2006), finds that the nature of volatility did not change with the introduction of futures trading in wheat, turmeric, sugar, cotton, raw jute and soya oil. Nevertheless, a weak destabilizing effect of futures on spot prices was found in case of wheat and raw jute. Further, the results of granger causality tests indicated that the unexpected increase in futures activity in terms of rise in. volumes and open interest caused an increase in the cash price volatilities in all the commodities listed.

3.OBJECTIVES:

- 1) To determine the relationship between the selected markets in commodity futures
- 2) To determine the relationship between spot and future price of the Commodity markets
- 3) To identify the arbitrage opportunities in the futures market.

4.HYPOTHESES:

Ho: Time series data is non Stationery

Ha: Time series data is Stationery

Ho: There is no significant long-run and short run association between commodity markets

Ha: There is significant long-run and short run association between commodity markets

Ho: Spot price does not granger cause future

Ha: Spot price does granger cause future

Ho: Future does not granger cause spot

Ha: Future does granger cause spot price

5.SOURCE OF DATA AND METHOD OF ANALYSIS:

Secondary data was collected for the study. The data was collected from NCDEX website from the years 2016 to 2022. Turmeric was choosed and price related data was collected .Agmarknet website used to collect price data from different markets like Nizamabad(Telangana), Erode(TamilNadu), sangli(Maharastra) and cuddapah(Andra Pradesh) from the year 2013-2023. The data was collected on the daily basis and modified by adding 0 in the no trading days.

Relationship between different Turmeric Market prices of Commodity Futures:

STATIONARITY TEST:

Regressing a non-stationary series on another without performing a stationarity test could result in create some erroneous outcomes. As a result, the variables that will be included in the regression model should be stationary. Even when it is discovered that the majority of the underlying price series are non-stationary, i.e.

$$\Delta Y_t = b_0 + \beta Y_{t-1} + \mu_1 Y_{t-1} + \mu_2 Y_{t-2} + \dots + \mu_p Y_{t-p} + \epsilon_t$$

where, Y_t represents time series to be tested

b_0 is the intercept term,

β is the coefficient of interest in the unit root test

μ_i is the parameter of the augmented lagged first difference of Y_t to represent the p th order autoregressive process,

ϵ_t is the white noise error term. In carrying out the unit root test, it is required to test the following hypothesis:

$H_0: \alpha=0$ (non stationary)

$H_1: \alpha \neq 0$ (stationary)

Table 2 : Regression analysis results

Market	Level statistic	probability **	stationarity	First difference statistics	probability **	stationarity	Critical Value(1%)
Erode (TamilNadu)	-2.8467	0.1744	Non-Stationary	-20.1564	0.0000	stationary	-2.4532
Nizamabad (Telangana)	-2.7766	0.2062	Non-Stationary	-14.3884	0.0000	Stationary	
Sangli (Maharashtra)	-4.4664	0.5017	Non-Stationary	-16.723	0.0000	Stationary	
Cuddapah (Andra Pradesh)	-2.0864	0.5524	Non-Stationary	-9.7882	0.0000	Stationary	

* Significance at 1 per cent level and**MacKinnon (1996) one-sided p-values

The time series data are stationary if the null hypothesis is rejected. Comparing the computed values of the Augmented Dickey-Fuller "T" statistic with the crucial values for the rejection of a hypothesis for a unit root is one of the deciding criteria. The null hypothesis of non-stationarity in time series variables cannot be rejected if the estimated ADF statistic is smaller than the critical values.

JOHANSEN COINTEGRATION TEST:

The Cointegration approach can be used to estimate whether there is a long-term equilibrium between the markets. For estimating, the maximum Likelihood approach developed by Johansen and Juselius is utilised, which explains the cointegration between the selected markets. Two tests are included in the cointegration analysis: the trace statistic and the maximum Eigen value test statistic.

Table 3 Unrestricted Cointegration test using Trace Statistic

Hypothesized No. of CE(s)	Eigen value	Trace Statistic	Critical Value (5 %)	Probability**
None *	0.01753	65.2505	46.8361	0.0005

Atmost1*	0.01341	37.3522	29.7970	0.0056
Atmost2*	0.0090	16.0488	15.4947	0.0412
Atmost3	0.0010	1.6618	3.84146	0.1974

Trace test indicates 3 cointegrating eqn(s) at the 0.05 level

* denotes rejection of the hypothesis at the 0.05 level

**MacKinnon-Haug-Michelis (1999) p-values

Table 4 : Unrestricted Cointegration Rank Test (Maximum Eigenvalue)

Hypothesized No. of CE(s)	Eigen value	Maximum Eigen statistic	Critical Value(5%)	Probability**
None *	0.01753	27.898	27.5843	0.0456
Atmost1*	0.01341	21.3034	21.1316	0.0473
Atmost2*	0.00908	14.3870	14.2640	0.0478
Atmost3	0.00105	1.6618	3.8414	0.1974

Max-eigenvalue test indicates 1 cointegrating eqn(s) at the 0.05 level; * denotes rejection of the hypothesis at the 0.05 level; **MacKinnon et.al (1999) p-values

At maximum rank 0, the null hypothesis states that there is no co-integration and alternate hypothesis is presence of co-integration. Here, the trace statistics (65.2505) exceeds the critical value (46.8361). Therefore, reject the null hypothesis, hence the markets are co integrated. Similarly, the maximum Eigen statistics (39.7003) is greater than critical value (27.5843) at 0.05 levels. Thus, the markets are co-integrated at maximum rank. At maximum rank 1, the null hypothesis states that there is co-integration of equation 1. It is inferred from the table that in Atmost3 the trace statistics (1.6618) does not exceed the critical value (3.8414). Therefore, accepting the null hypothesis showed that the co-integration of equation 1. A similar condition is observed for the maximum Eigen statistics. Therefore, Vector Error Correction model can be applied based on the result of Johansen co-integration test

GRANGER CASUALITY TEST:

The cointegration test demonstrated the existence of a long-term connection between the Turmeric markets. The Granger-Causality test is used to determine the direction of the relationship between the markets in the long-run equilibrium. The null hypothesis, according to which there is no granger source for price variations between marketplaces, forms the basis of the test. The null hypothesis is disproved due to the significance of the probability value, indicating that a change in one market's price affected other markets' pricing.

Table 5 : Granger-Causality test

NULL HYPOTHESIS	Observations	F-Statistic	probability	Relation
ERODE_MODAL_PRICE_RS_QUINTAL__does not granger cause	1580	8.66481	0.0002	E → C
CUDDAPAH_MODAL_PRICE_RS_QUINTAL CUDDAPAH_MODAL_PRICE_RS_QUINTAL dose not granger cause		8.47448	0.0002	C → E
ERODE_MODAL_PRICE_RS_QUINTAI				
NIZAMABAD_MODAL_PRICE_RS_QUINTAL__ dose not granger cause	1580	1.48193	0.2275	NS
CUDDAPAH_MODAL_PRICE_RS_QUINTAL				

CUDDAPAH_MODAL_PRICE_RS_QUINTAL_ dose not granger cause NIZAMABAD_MODAL_PRICE_RS_QUINTAL		3.31538	0.0366	C → N
SANGLI_MODAL_PRICE_RS_QUINTAL_ dose not granger cause CUDDAPAH_MODAL_PRICE_RS_QUINTAL CUDDAPAH_MODAL_PRICE_RS_QUINTAL_ dose not granger cause SANGLI_MODAL_PRICE_RS_QUINTAL	1580	0.02504	0.9753	NS
NIZAMABAD_MODAL_PRICE_RS_QUINTAL_ dose not granger cause ERODE_MODAL_PRICE_RS_QUINTAL ERODE_MODAL_PRICE_RS_QUINTAL_ does not granger cause NIZAMABAD_MODAL_PRICE_RS_QUINTAL	1580	0.49080	0.6122	NS
SANGLI_MODAL_PRICE_RS_QUINTAL_ dose not granger cause ERODE_MODAL_PRICE_RS_QUINTAL ERODE_MODAL_PRICE_RS_QUINTAL_ does not granger cause SANGLI_MODAL_PRICE_RS_QUINTAL	1580	3.65105	0.0262	S → E
SANGLI_MODAL_PRICE_RS_QUINTAL_ dose not granger cause NIZAMABAD_MODAL_PRICE_RS_QUINTAL NIZAMABAD_MODAL_PRICE_RS_QUINTAL_ dose not granger cause SANGLI_MODAL_PRICE_RS_QUINTAL	1580	0.23227	0.7928	NS
		0.58708	0.5561	NS

NS: Non significant

Table 6 : National Market

National Market	
Erode	↔ Cuddapah
Cuddapah	→ Nizamabad
Cuddapah	→ Sangli
Erode	→ Nizamabad
Sangli	→ Erode
Nizamabad	→ sangli

The above table shows the Bidirectional and unidirectional relationship between different markets. If the probabillity value is significant i.e less than 0.05 . there is a presence of granger cause by one

market and another. One market's price influenced by other market's price. If the probability value is non significant there is no Granger Cause between two Market prices.

Here, There is a Bidirectional Relationship between Erode and Cuddapah Market. Cuddapah Market granger cause Erode market i.e Erode Market price was influenced by Cuddapah market's price. The probability value between Nizamabad and Cuddapah market is 0.2275 i.e Non Significant so there is no Relationship between one market's price with another. Likewise Sangli and Cuddapah market's prices has no influence on each other. The probability Value of Nizamabad and Erode market was 0.6122 , so Nizamabad's Market price doesn't influence Erode Market's prices. But Erode Market's prices was influenced by Nizamabad Market's prices because of the Probability value 0.0548. Erode Market's price was influenced by Sangli Market's prices because of the significant probability value 0.0262 but sangli Market's price doesn't influence Erode Market's price because of Non significant probability value 0.9287.

Table 7 : Relationship between Spot and Future Price of the Commodity market:

Null Hypothesis	Observation	F-Statistic	probability	Relation
CLOSE_PRICE_IN_RS_dose not granger cause SPOT_PRICE_BASIS_VARIETY_RS_	3703	3.77369	0.0021	CP → SP
SPOT_PRICE_FOR_BASIS_VARIETY_RS_dose not granger cause CLOSE_PRICE_IN_RS		47.8289	4.E-48	NS

The above table shows that close price granger cause spot price. Spot price was influenced by the future price of the commodity. The probability Value between the close price and spot price was 0.0021. here we come to know that Today's closing price will have impact on Tommorrow's Spot Price.

Scope of Arbitrage:

To study the scope of arbitrage standard deviation between future open and close price was calculated. The below table indicate that there is not much difference between the mean and standard deviation in the opening and closing price of future contracts therefore, not much arbitrage opportunity exists. The low arbitrage opportunity is nullified by the transaction cost.

Table 8 : Descriptive statistics

	LN Close price	LN Future Price
Mean	8.876198	8.867471
Median	8.870663	8.891051
Maximum	9.319015	9.168612
Minimum	8.252446	8.287365
Std.Dev	0.0145180	0.142786
Skewness	0.351745	-0.150647
Kurtosis	3.108955	2.528876
Jarque-Bera	97.41019	60.11044
Probability	0.000000	0.000000
Sum	40945.90	40905.64
Sum Sq.Dev	97.20805	94.02923

6.CONCLUSION:

There is a Dynamic relationship between spot and future price of the Commodity Futures and also between different markets. One Market's price granger cause Another Market's price. Some Markets will have no influence on other markets price.

Arbitrage opportunity: Underpricing of Future contracts lends scope for arbitrage opportunity but it depends on the type of commodity, timing and the magnitude of underpricing.

Limitations of the study:

1. This work only examines the Turmeric product. Other commodities can be the subject of research, with results that can be applied to the entire commodity market.
2. Although the prospect of arbitrage is not present in the case of turmeric, it cannot be extrapolated to other commodities.
9. Scope for Future Research: 1. Further research on major agricultural commodities can be done 2. Other issues like if commodity future market is fairly priced or not can be studied.
