

Anthropogenic Impacts on Lakes of Mysore city: A Review of Literature

ABSTRACT:

Mysore is the second largest city in the state of Karnataka in India. It is one of the most attractive tourism places. It is well known for its world famous palace, art galleries, gardens, temples, churches, mosques, mansions and museums. Mysore is also known for its rich culture and heritage. Mysore is located in a very unique environment. The popular and perennial river Cauvery and one of its tributaries Kabini are draining through this district. The Krishnaraja Sagara Dam and the Kabini Dam are the large reservoirs existing in this region. These dams irrigate the fertile agricultural lands out of which a huge population survives. The city of Mysore is blessed with a number of lakes which are promoting a salubrious climate for the city dwellers. At present lakes are under threat as they are victims of population pressure, rapid urbanization. If this trend continues, man is endangering not only humans but also other creatures on earth. This paper is a review of published literature on the anthropogenic impacts on lakes of Mysore city and measures for their conservation.

Keywords: Human impacts, Conservation, Lakes, Ecosystem.

1. INTRODUCTION:

Water is indispensable and one of the most abundant resources of nature and prime necessity for the survival of life. The availability of water both in terms of quality and quantity is essential for the existence of the living world. The rapid industrialization, urbanization and modern civilization (increased population) have led to the increasing demand for water in domestic, agricultural and industrial sectors. Surface water comprises of flowing freshwater system (lotic). Such as, river, streams, canals etc. and static freshwater system (lentic). Like ponds, lakes and reservoirs etc. lakes comprise one of the most productive ecosystems. Lake environments are comprised of physical, chemical and organic properties contained inside these water bodies. A word lake coming from "Latin" word "lacus" is a large body of water (larger and deeper than a pond) within a body of land. A lake is an area filled with water, a larger of water surrounded by land. Many lakes are artificial and constructed for industrial or agricultural use, for hydro-electric power generation or domestic water supply or for aesthetic, recreational purposes or other activities.

Lakes are bodies of water that occupy depressions on land surface. A lake is a naturally occurring, relatively large body of water localized in a basin completely surrounded by dry land. Lakes are typically much larger and deeper than ponds, which are also water-filled basins on land. Artificially controlled lakes are known as reservoirs and are usually constructed for industrial or agricultural use, for hydroelectric power generation, for supplying domestic drinking water, for ecological or recreational purposes, or for other human activities. The development of human race, lakes are facing threat from anthropogenic activities. The ecosystem services provided by lakes are overloaded and they are being converted to other land uses, fragmented, polluted and destroyed.

2. OBJECTIVE :-

The objective of this study is to gain information regarding the anthropogenic impacts on lakes of Mysore city.

3. STUDY AREA :-

Mysore city is one of the historical and heritage city and the second largest city in karnataka state. Mysore city is geographically located between 12° 18' north latitude and 76° 39' east longitude. It is located at an altitude of 770meters (2.526 feet).It encompasses an area of 6307 sqkm and a population of 30,01,127.Mysuru is located in the southern part of the Deccan plateau. Mysuru has a warm and cool climate throughout the climate of mysuru is moderate. The minimum temperature in winter is around 15 degrees celsius and in summer the maximum temperature is around 35 degrees celsius. 86 centimeters is average annual rainfall.

4. METHODOLOGY:-

An extensive survey of literature was undertaken to find out the anthropogenic impacts on lakes of mysore city. online journals, thesis and articles were accessed through search engines like google scholar, research gate, shodhganga etc. Morethan 90 studies relating to lakes of mysore city were collected. After reviewing the collected literature, only those studies which evidently pointed out the human impacts on lakes of mysorecity were included in this study. Then the selected literature were categorized according to the type of lake each study pertained to. Attempt hasbeen made to include as many studies as possible, however few studies may have been left out due to inadequacy of resources.

5. RESULTS AND DISCUSSION :-

Kukkarahalli Lake

Karanji Lake

Lingambudhi Lake

Hebbal Lake

Bogadhi Lake

Dalvoy Lake

5.1 KUKKARAHALLI LAKE :-Kukkarahalli Lake located in the heart of the Mysore city, adjoins the Manasagangothri, Kalamandir, CFTRI (Central Food Technological Research Institute) campus. It provides lung-space to the city. Mummadi Krishnaraja Wodeyar (1794-1868) of the Mysore dynasty was created the lake in the year 1864, to provide water for irrigation to about 4000 hactare (10000 acres) of land outside the city. The total area of Kukkarahalli Lake about 104 ha.The lake also used to be a source of water supply to the city of mysore. But after many years the man intervention cause to sewage and excessive land encroachment and blockage of water flow sources almost led to

the eutrophication of the lake. [Murthy.P. et al 2014 The Innovative](#) water quality index for [kukkarahalli](#) lake of Mysore city, karnataka, India they was analyzed of only 5 water chemistry parameters like dissolved oxygen, Total Phosphorous, Turbidity, Specific conductance and fecal coli forms were analyzed. [Kukkarahalli](#) Lake had an index value between 1.7 and 2.3. poor water quality in lakes imparts the lives of many species including fish and plants. This is often due to the nutrient loads from agricultural fertilizer run off, chemical pollutants, faces and urine of fish and animals. Due to such processes sludge develops and become [overabundants](#) oxygen saturation reduces and fish [mortality](#) rates increases. Permanent blooms of cyanobacteria were recorded in [Kukkarahalli](#) Lake. [Kukkarahalli](#) Lake differ in size and shape, usage, nature of anthropogenic disturbance. [Kukkarahalli](#) Lake polluted day by day, which was demonstrated by Anima [Upadhyay .M. Chandrakala](#) a very concentration of calcium and magnesium ions in the lake water. It shows a very high Ph, Alkalinity and Total hardness that makes the water unfit for both drinking and irrigation purposes. Through the inflow of the sewage water into the lake water highly contaminated for use.

5.2 KARANJI LAKE :- [Karanji](#) Lake is located in the city of [mysore](#) in the state of karnataka [india](#). The lake is surrounded by a nature park consisting of a butterfly park and a walk-through aviary. There is also a museum, the Regional Museum of Natural history which is located on the banks of this lake. The total area of [karanji](#) lake is 90 hectares. [Karanji](#) lake is owned by the Mysore Zoo Authority. [Adarsh](#).et al 2019 water quality assessment of lakes in [mysuru](#). India – A case study they was studied to bring out the assessment of quality of lakes in [mysore](#). Results shows that lake are polluted due to disposal of sewage or through the industrial effluents. Being a percolation lake, it started getting polluted when sewage water made its way into the lake. This if not controlled and checked properly will lead to the destruction of a wonderful tourists attraction and nature's gift to the mankind. The [karanji](#) lake is facing serious problem of inflow of huge quantity of drainage water from the [UGD](#). Running from the [adjoining](#) residential areas [siddartha](#) layout and dairy industry. [Physico](#)-chemical analysis of [karanji](#) lake water [mysore](#), karnataka, [india](#) explained by [Anima upadhyayM, Chandrakala M. Lake deterioration](#) due to improper town planning and development, dumping of garbage and sewage in the soil of the [cathment](#) area of the lake and leaky underground drainagesystem. [H.K. Renushree and Dr. H.R. Uma](#) conducted the study of [karanji](#) lake, the unplanned human interventions in the form of population growth, urbanization, sewage absorbs and other negative fall-outs have affected the fragile environment of the lake.

5.3 LINGAMBUDHI LAKE :- [Lingambudhi](#) Lake is a lake in the city of [mysore](#). The lake was [build](#) by [Maharaja Krishnaraja Wodeyar III](#) in 1828. In memory of his fourth consort [Maharani Lingaja Devi \(LingajaambaAmmanni Devi, Krishna VilasaSannidhana\)](#). [Murthy et al 2014 The Innovative water quality India \(IWQI\) for](#) [Lingambudhi](#) Lake of [mysore](#) city, karnataka, India. They was analyzed of five water chemistry parameters. Dissolved oxygen, total phosphorous, turbidity, specific conductance and fecal coli forms were analyzed. [Lingambudhi](#) Lake had an index value 1.9 and 2.2 and is rated between marginal and acceptable. Poor water quality in lakes imparts the lives of many species including fish and plants. This is often due to the nutrient loads from agricultural fertilizer run off, chemical pollutants, faces and urine of fish and animals. Due to such processes sludge develops and become [overabundants](#) oxygen saturation reduces and fish [mortality](#) rates increases. Permanent blooms of cyanobacteria were recorded in [Lingambudhi](#) Lake. It shows a very high Ph, Alkalinity and Total hardness that makes the water unfit

for both drinking and irrigation purposes. Through the inflow of the sewage water into the lake water highly contaminated for use. **M.N.Naganandini** water quality index for protection of aquatic life **Lingambudhi** Lake at **mysore** was studied the **CCME-WQI** rates the lake water of **Lingambudhi** as poor and the water quality is always threatened which deviates considerably from normal. Storm water harvesting and removal of limiting nitrates and phosphates from urban water runoff and as well, limiting the anthropogenic activities around the lake are among the promising solutions in regulating the entry of nutrients in to the lake. The **CCME-WQI** serves as an additional tool in monitoring lake water quality.

5.4 HEBBAL LAKE :- **Hebbal** Lake is a lake in the city **mysore**. **Hebbal** Lake was highly polluted by the inflow of industrial effluents, **sewage** and refuse. A recovery project is under way to set up a sewage treatment plant and tackle the pollution problem. **Thousands of dead and rotting fish at Hebbal Lake**, officials from the **karnataka state pollution control board (KSPCB)** have collected samples of water that enters into the lake. The heavy water with a heady mix of industrial effluents have caused the fish death. **KSPCB** officers and team collected water samples from around the lake and also collected samples where the largest concentration of fish death has **occured**. Also samples from the place where industrial effluents enter the lake were gathered and information was collected on the sewage flow into the lake from the residential localities around the lake. Published by Star of Mysore. Water quality is rated as poor. The water quality is almost endangered or deteriorated and the conditions often deviate from natural levels. The lake water is unsuitable to protect aquatic life. Incidence of fish kill occurred in 2011 due to contamination of water. Anthropogenic activities are found and large numbers of industries are situated around the lake. Demonstrated by **Dr.M.K.Mahesh, B.R.Sushmitha, H.R.Uma** assessment of water quality of **hebbal** lake of **mysore**.

5.5 BOGADHI LAKE :- **Bogadhi** lake is one of the oldest lake of **mysore** city. This lake comes under the supervision of **mysore** city corporation (MCC). It is said that the **Bogadhi** lake is probably as old as **lingambudhi** lake (approximately 190 years old), which is located at **Bogadhi** road opposite to the Anthropological survey of **india** close to the **Nirmithikendra** in **Vijayanagara** 3rd stage. The lake has rough area coverage of 7.5 hectare and an average distance of 4.2mi from the **centre** of the **mysore** city. This lake is an upstream lake of **lingambudhi** lake. The whole water collected was earlier used for the farming and irrigation purpose in and around the **bogadhi** village. And also **bogadhi** lake is the catchment area for the entire **vijayanagara** 3rd stage as the water from all the drains will flow into this lake. This is the major groundwater recharge **piont** for the **vijayanagara** and **bogadhi**. As the lake is very much near to the **munciple** solid waste collection site (transfer station) . it is needed to be guarded well and requires frequent cleaning, at least twice a week. But due to the negligence of the city corporation the plastic and other waste which are dumped in at site are flowing towards the lake and blocking the inflow channel. The people, who are living in and around the lake are generally low in their literacy rate and comes under low income group (LIG) category. In the summer season the lake dries up about 60-70% and the ground surface of the lake contaminated with plastic glass and other non-degradable wastes affecting percolation and recharge of the water from the surface to the perched water table and ground water aquifer.

5.6 DALVOY LAKE :-Dalvoy lake is one of the major water bodies located in south of mysore adjacent to nanjungud road. It was constructed during period of maharaja in 19th centuary for irrigation, drinking and for other related purpose. The catchment area of dalvoy lake is 2615 acres covering shettykere, dalvoyserie, Gudumadanahally pickup and marshy pickup. Mahesh and A.Balasubramanian analysis of water quality index (WQI) in dalvoy lake mysore city, india. The water quality indicators were calculated for all locations and also classified with reference to seasons. It was observed that the WQI of the Dalvoy lake is not good and the main cause of deterioration is due to the lack of proper sanitation, untreated inflow water with munciple sewage and due to uncontrolled anthropogenic activities. AkshathaN.ShankarB conservation Measures for Improving land use and land cover in dalvoy lake environs of mysore city. They analyzed it is deteriorating as a result of land use change, growth of industries and urbanization pressures. The tropic state of dalvoy lake is under tremendous pressure due to Nitrate and phosphate loading and the impact of human activities. The pollution level of this lake can be seen from the outflowing water. As it is located near the national highway, human influence are more to this lake. Mysore city lakes by A.Balasubramanian, Mahesh kalasaiah.

6. CONCLUSION :-

A lake is a body of water that is surrounded by land. Lakes are extremely varied in terms of their origin, occurrence, size, shape, depth and other features. They are dynamic ecosystems. Most of them are under the direct or indirect influences of the ever increasing human activities and development. A lot of natural or man-made factors may lead to the deterioration of lakes and their survival. Protection of a lake from pollution or degradation is a major aspect of development.
