

### **Editor's Comment:**

PLC is exceptionally hypopigmented from the outset. The report a case of chronic leucomelanodermic pityriasis lichenoides in a child posing a problem of differential diagnosis and treatment .

1 ) The "General impression" is innovative to some extent and can be considered for publication after modification.

2 ) Novel topic, design science, closely combined with clinical diagnosis and treatment,

A skin biopsy was then performed,in favor of Pityriasis Lichenoides Chronica (PLC) with a lymphoid infiltrate made up mainly of CD4 T lymphocytes.The child was put on cyclin associated with heliotherapy with regular monitoring.

1) Correct research method, A skin biopsy was then performed,in favor of Pityriasis Lichenoides Chronica (PLC) with a lymphoid infiltrate made up mainly of CD4 T lymphocytes.

2) Reliable argument and research data.

6) 8 of the references is old and only one is new Australas J Dermatol 2022 Feb;63(1):68-73. so so be add other new one .
