

Editor's Comment:

About the work JERR 96837 "INFLUENCE OF POTASH ON BIOGAS PRODUCTION FROM COW DUNG AND FOOD WASTE#", I have seen the original article, the several important comments of the referees and the second version.

I see that in the second version of the article, the authors practically only correct some errors in English, but they do not answer or say anything about the other observations, such as the one about Fig. 1, that the two referees see no purpose in it. Also, why the measurement of methane is not mentioned, being most important to know what is the amount produced, in addition to the other gases. And explain why the use of potash can increase biogas production. That is, the hypothesis about using potash.

The authors must respond specifically to each point indicated by the referees, satisfactorily, not only with one general "done", and make the corrections in yellow in the text.

On the other hand, the references in the text must be ordered in increasing numerical sequence: [1], [2], [3], etc.

Authors must promptly make the corrections indicated by the referees or justify why they do not do it.
