

Editor's Comment:

Dear Ruma:

These are my comments:

The manuscript requires a new round of revision where the authors should address important topics not discussed for the reported case:

There is no information about the parathyroid glands, only PTH dosage.

What anticoagulant treatment was chosen when vitamin K antagonists were discontinued? The authors do not refer to the possibility of using calcimimetics such as cinacalcet, which are of great importance in reducing PTH and calcemia.

Minor comments:

The sentence "We also stopped VKAs as a factor favoring calciphylaxis and given the increased risk of" is incomplete.
