

Editor's Comment:

I have read the new version of the article, but it still contains some mistakes.

For ex, the phrase:

.....metabolic disorders, pre-eclampsia during pregnancy, aortic coarctation, kidney disease, and other congenital anomalies are common secondary causes of hypertension.

Metabolic disorders are cardiovascular risk factors, not a cause of secondary hypertension.

And "other congenital anomalies" - refers to what?

Things about secondary arterial hypertension are very well established.

The section intitled "Anti-hypertensive drugs." does not speak about the classes of antihypertensive medication....

The Discussion section is missing.

I reject the manuscript.
