

Bio Efficacy and Economics of Systemic Insecticides against Whitefly in Potato

ABSTRACT

A field experiment was conducted at Potato Research Station, S. D. Agricultural University, Deesa during 2018-19 and 2019-20 for evaluation of efficacy of insecticides against whitefly in potato. The seven different treatments viz. T₁: Control, T₂: Seed treatment with imidacloprid (200 SL) @ 0.04% followed by foliar sprays of imidacloprid @60 gm a.i./ha at 85% emergence + second spray with thiamethoxam 25WG @100g a.i./ha, T₃: Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence, T₄: Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence followed by second spray of diafenthiuron after 10 days, T₅: Foliar spray of castor oil @0.05% at 85% emergence, T₆: Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence mixed with castor oil @0.05%, T₇: Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence mixed with castor oil @0.05% by second spray with diafenthiuron after 10 days. Based on pooled data of two years, the significantly highest per cent reduction (*i.e.* 68.57 %) after 2nd spray was recorded in T₇ *i.e.* foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence mixed with castor oil @0.05% by second spray with diafenthiuron after 10 days which was at par with T₄ (Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence followed by second spray of diafenthiuron after 10 days). The tuber highest yield and benefit cost ratio were also recorded with T₇.

Keywords: Potato; whitefly; management; difenthiuron; sucking pest.

1. INTRODUCTION

“Potato (*Solanum tuberosum* Linn.) is an important vegetable crop cultivated throughout the world. It is a perennial herb belonging to family *Solanaceae*, a native of Andean Plateau of South America. The power of potato is known for sustaining millions of lives by providing nutritious food in the time of war and hunger and also used as a staple food in several countries of the world. Globally, it is ranked as the fourth most important food crop after maize, wheat and rice with approximately having double calories per hectare. It has maximum uses for making potato flour, potato chips, french fries, frozen potato, potato starch and tapioca of potato. Each 100 g serving of fresh potato, provides protein (1.6 g), carbohydrate (22.6 g), minerals (0.6 g), crude fibre (0.4 g), fat (0.10 g), vitamin C (25 mg)” [1]. “Potato contains significant levels of phenolic compounds and vitamin C as potent antioxidants [2], which inactivate reactive oxygen species, reduce oxidative damage, lead to improved immune functions and reduce risk of cardiovascular diseases, cancer, cataract, diabetes and ageing” [3]. Recognizing the major role of potato as a staple food and providing food security, the year of 2008 was declared as the International Year of the Potato by the United

Nations [4]. Hence, potatoes are called “King of Vegetables”.

This crop is attacked by several pests in the field and in store. According to Simpson [5], “potato is attacked by more than 100 arthropod pests among them 80 have been reported from India” [6-9]. “Among various insect-pests; aphids, jassids, cutworms, white grubs, epilachna beetles, defoliating caterpillars and potato tuber moths are serious and responsible for considerable economic losses, while the rest are sporadic and of minor importance. Among the sucking pests the whitefly, *Bemisia tabaci* Gennadius (Hemiptera: Aleyrodidae), is a worldwide polyphagous insect pest that has wreaked havoc on agricultural productivity, particularly in some plant families such as *Solanaceae*, *Cucurbitaceae*, and *Fabaceae*” [10,11]. “The potato whitefly, *Bemisia tabaci* (Gennadius) is the most destructive [12] pests of numerous crops” [13]. “*Bemisia tabaci* biotype A (Gennadius) has the ability to transmit 111 economically important viruses” [14]. By keeping in mind notorious devastating sap-sucking insect pest this experiment was conducted for evaluation of various systemic insecticide against potato whitefly.

2. MATERIALS AND METHODS

The field experiment was conducted at Potato Research Station, S. D. Agricultural University, Deesa to study the management of whitefly in potato for two consecutive years *Rabi* 2018-19 and 2019-20. The experiment was laid out in a randomized block design with seven treatments and five replications with 3.0 m × 2.0 m plot size. The planting was done at row spacing of 50 cm and plant to plant spacing of 20 cm. The recommended dosage of fertilizers 275 kg N, 138 kg P and 275 kg K per hectare was applied. Insecticides were sprayed using high volume knapsack sprayer with 500 L ha⁻¹ solution. Seven different treatments viz., T₁: Control, T₂: Seed treatment with imidacloprid (200 SL) @ 0.04% followed by foliar sprays of imidacloprid @60 gm a.i./ha at 85% emergence + second spray with thiamethoxam 25WG @100g a.i./ha, T₃: Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence, T₄: Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence followed by second spray of diafenthiuron after 10 days, T₅: Foliar spray of castor oil @0.05% at 85% emergence, T₆: Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence mixed with castor oil @0.05%, T₇: Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence mixed with castor oil @0.05% by second spray with diafenthiuron after 10 days were evaluated for bio efficacy. Observations were taken on whitefly numbers before the foliar spray and on per cent reduction after 24, 48 and 72 hours of the spray on 5 tagged plants (3 leaves lower, middle and upper) as per method described by Butter and Vir [15]. The per cent reduction was work out by using standard formula. Two years data were pooled and then subjected to statistical analysis using the software OPSTAT developed by HAU, Hisar.

3. RESULTS AND DISCUSSION

It was observed that there were non-significant differences in whitefly counts in all the treatments before first spray (Table 1). The significantly highest percent reduction (*i.e.* 56.35 %) after 1st spray during *rabi* 2018-19 was recorded in T₇ (Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence mixed with castor oil @0.05% by second spray with diafenthiuron after 10 days) which was at par with T₆ (Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence mixed with castor oil @0.05%) recorded 54.21% reduction, T₃ (Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence) recorded 48.62% reduction and T₄ (Foliar spray of diafenthiuron

50WP 350 g a.i. at 85% emergence followed by second spray of diafenthiuron after 10 days) recorded 46.79% reduction. The similar trend was also observed in pooled data while in *rabi* 2019-20, significantly higher reduction per cent were recorded in all the treatments except T₅ (Foliar spray of castor oil @0.05% at 85% emergence) over untreated control (Table 1).

The significantly highest percent reduction (*i.e.* 62.70 %) after 2nd spray during *rabi* 2018-19 was recorded in T₇ (Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence mixed with castor oil @0.05% by second spray with diafenthiuron after 10 days) which was at par with T₄ (Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence followed by second spray of diafenthiuron after 10 days) and T₂ (Seed treatment with imidacloprid (200 SL) @ 0.04% followed by foliar spray of imidacloprid @60 gm a.i./ha at 85% emergence+ second spray with thiamethoxam 25WG @100g a.i./ha). The next best treatment in sequence was T₆ (Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence mixed with castor oil @0.05%) and T₃ (Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence). In *rabi* 2019-20 significantly highest percent mortality (*i.e.* 74.44 %) after 2nd spray was recorded in T₇ which was at par with T₄ (69.68%). The next best treatment in sequence was T₂ (62.09 per cent reduction). The similar trend was also observed in pooled data. The zero per cent reduction was recorded in T₅ in both years as well as in pooled data. (Table 2).

The economics of treatments shows that higher BC ratio (2.26) was recorded in T₇ (Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence mixed with castor oil @0.05% by second spray with diafenthiuron after 10 days) which was followed by T₄ (Foliar spray of diafenthiuron 50WP 350 g a.i. at 85% emergence followed by second spray of diafenthiuron after 10 days). (Table 3)

Present results are in agreement with findings of Yadav *et al.* [16] they reported that “two sprays of diafenthiuron 50WP 350 g a. i./ ha mixed with castor oil @ 0.05% at 10 days interval gave maximum mortality (82.0%), maximum tuber yield (24.7 t/ ha) with incremental cost benefit ratio (ICBR 1:2.1)”. Tomar *et al.*, (2017) reported “the highest reduction of potato whitefly was recorded in Difenthiuron 50 SC @ 350 g ai/ha (84.13%) in comparison to rest of insecticide”. Meenu and Dahiya [17] observed that “diafenthiuron 50 WP @ 500 g/ ha showed better performance against *B. tabaci*. Bharpoda *et al.*

[18] found that diafenthiuron 50 WP (at 0.05%) 17.8 SL (at 0.008%) against *B. tabaci* was the most effective compared to imidacloprid

Table 1. Per cent reduction of potato whitefly after first spray (2018-19, 2019-20 & pooled)

Treatment	1 st Spray

T ₇	50.62	139550	455580	9000	316030	2.26

Rajasekhar *et al.* [19] observed that “diafenthiuron 50% WP @ 1.25 g/ l was found effective in cotton. Praveen *et al.* (2019) found that diafenthiuron 50%WP @ 1 g/ l and triazophos 40 % EC @ 2 ml/ l were found effective against whitefly in sunflower”. Thumar *et. al.*, [20] “diafenthiuron 25% + pyriproxyfen 5% SE @ 1000 and 1250 ml/ha were found relatively more effective against sucking insect pests *viz.*, aphids, leafhoppers, whiteflies and thrips in Bt cotton”. “Two doses of diafenthiuron 25% + pyriproxyfen 5% SE (1250 and 1000 ml/ha) also gave highest seed cotton yield. Furthermore, previous reports demonstrated extreme effectiveness of diafenthiuron against whitefly” [21-26] on different crops.

4. CONCLUSION

It is concluded that the foliar spray of alone diafenthiuron 50WP @ 350 g a.i/ha or in combination with castor Oil @ 0.05% at 85% crop emergence and followed by at 10 days interval for the management of potato whiteflies and higher net returns.

ACKNOWLEDGEMENTS

The financial assistance and support extended for the project by ICAR-AICRP (Potato) and SDAU, Sardarkrushinagar are highly acknowledged.
