

Editor's Comment:

This paper aimed to investigate the degree of influence of various factors on non-STEM students shifting to STEM-related college programs in a Catholic university in the Philippines. Using qualitative research, among a sample of 214 college students, results showed that work opportunities are the most dominant influencing factor in the shift of non-STEM students to STEM-related college programmes. The findings of the study will serve as a basis for the preparation of a career orientation program to assist students in deciding on their career path.

The reviewers did a very good critical review of the manuscript. The author has addressed the very minor concerns of the reviewers and revised the manuscript accordingly. I hereby recommend publication in the Asian Journal of Education and Social Studies.
