

Editor's Comment:

The study is interesting, However, I would accept it after some minor changes.

Comments:

1. I am left wondering how the authors identified the microorganisms in the post-surgical site infection ? Why was it not described in the methodology?
2. In this part "The advance age with male gender may contribute to increased rate of surgical site infection ". Why? Authors need more discussion about it.
3. In this part "Diabetis mellitus and immunodepression status especially HIV were the two majors' comorbidities". Why? Discuss more about it.
4. The references are very old, the authors should look for more articles or more recent information.
