

Editor's Comment:

punctuation & grammar - I suggest the final submittal should be properly punctuated before final approval can be issued; and

Scientific basis - the rules of engagement regarding such concepts as dark matter, dark energy, superluminal velocities and dilation of time suggest that such speculative notions should not be relied on to form the basis of the thesis. The axiom that science is fiction - it only holds until we change our minds - may be more correct than we know. Nevertheless, I do not accept the premise of the thesis as long as its conclusions are based on the specious notion that dark energy is the primary, operative causal dynamic. You may publish this paper but I believe its premises and conclusions are not scientifically sustainable.
