Changes in Livelihood and Utilization Pattern of Farm Pond Owners in Drought Regions of Maharashtra, India

ABSTRACT

The study aimed to assess the impact of farm pond adoption on the livelihood of beneficiaries in drought-prone regions of Maharashtra, India during 2022-23. Data from 160 beneficiaries and 160 non-beneficiaries were collected through a combination of quantitative and qualitative methods, including focus group discussions and semi-structured interviews. The results indicated a significant increase in various aspects of beneficiary activities, including the utilization of women's productive time (MS 0.43 to 2.47), the regular employment generation index (MS 81.54 to 151.04), the livestock composition index (MS 1.46 to 2.39), the enterprises cost-effectiveness index (MS 17.27 to 48.83), the cultivated land utilization index (MS 0.22 to 0.67), and the irrigability index (MS 2.17 to 16.88). In terms of investment, horticultural crops received the highest allocation (MS 401) followed by animal husbandry (MS 360) and agricultural crops (MS 236). Farm pond income was predominantly directed toward purchasing farm inputs (56.88%), with a smaller portion allocated to equipment (18.13%) and the least to non-agricultural businesses (1.25%). Overall, the findings showed a significant improvement in the livelihood component of farm pond owners (MS 84.09), with the employment component exhibiting the highest mean score of 81.33, followed by the economic component (MS 75.97). These findings underscore the transformative potential of farm pond adoption in drought-prone regions, as it enhances livelihoods, empowers gender roles, and promotes diversified and sustainable agricultural practices within the locale of the study.

INTRODUCTION

Maharashtra, a state in western India, has long grappled with the challenges posed by drought and water scarcity, particularly in its arid and semi-arid regions (Patel *et al.*, 2020). In these areas, traditional agriculture has often been constrained by unreliable rainfall and inadequate irrigation infrastructure (Raman & Khan, 2020). However, a promising shift has been observed among farm pond owners in these drought-prone regions, as they embrace innovative farming practices to mitigate the impact of water shortages and transform their agricultural landscapes (Singh *et al.*, 2022 & Gireesh *et al.*, 2023). Farm ponds, reservoirs constructed on farmlands to capture and store rainwater, have emerged as crucial assets in addressing the water crisis. These ponds serve as a lifeline for small and marginal farmers who rely on rainfed agriculture (Rao *et al.*, 2020). Over the past few years, farm pond owners in Maharashtra have recognized the potential of these reservoirs not only for water storage but also as a catalyst for sustainable farming practices (Shivakumarappa *et al.*, 2023). Farm pond owners are now implementing efficient water management techniques, ensuring optimal utilization of the stored rainwater. Drip irrigation, sprinkler systems, and precision farming methods have become common, reducing water wastage and enhancing crop yields (Koech, & Langat, 2018). The availability of reliable water sources from farm ponds has encouraged farmers to diversify their crop choices. They are moving away from water-intensive crops

and exploring drought-resistant and high-value crops, such as pulses, millets, and horticultural produce (Robert *et al.*, 2017; Rao *et al.*, 2017;Gireesh & Kumbhare, 2022). Enhanced farming practices are not only improving agricultural productivity but also the financial well-being of farm pond owners. Increased yields and diversified income sources are helping them combat the economic uncertainties associated with drought(Das *et al.*, 2013). This transformation among farm pond owners in drought-prone regions of Maharashtra signifies a paradigm shift in sustainable agriculture (Shah *et al.*, 2021). It showcases the potential of harnessing rainwater through farm ponds as a means to combat water scarcity, boost agricultural productivity, and improve the overall livelihoods of farmers in these challenging environments (Shah *et al.*, 2021&Prasad *et al.*, 2022). The journey towards more resilient and sustainable agriculture in Maharashtra is a testament to the power of local innovation and community-driven solutions in addressing critical regional challenges(Shah & Vijayshankar,2022).By bolstering agricultural resilience through extensive farm pond integration, drought region can fortify its agricultural sector, enhance food security, and empower farmers to grapple with the vagaries induced by climate change (Prasad *et al.*, 2022 &Gireesh *et al.*, 2023).Acknowledging the pivotal role of farmponds, the Maharashtra government introduced the '*Magel Tyala Shet Tale*' (farm ponds on demand) initiative in 2016, extending partial subsidies to farmers for farm pond construction. This study endeavours to unearth change in agricultural activities and farm pond practices, with the intent of formulating sustainable extension interventions to surmount challenges faced by farmers within the locale of the study. The insights garnered from the study will enrich our holistic comprehension of the exigency and status of farm ponds in Maharashtra, facilitating well-informed decision-making, targeted investments, and the formulation of robust policies conducive to sustainable agricultural practices in the state. By accentuating the enhancement of agricultural resilience through farm ponds, Maharashtra charts a course toward a more secure and prosperous future for its agrarian communities. This paper isofocus on change in livelihood and utilization pattern of farm pond owners in drought prone areas of Maharashtra, India.

MATERIAL AND METHODS

For this study, an *ex post facto* research design was used. The Marathwada and Vidarbha regions of Maharashtra were chosen for the current study as they are highin their drought-affected state. Two districts were selected from each region, and further two blocks from each district were selected purposively due to having the highest number of farm ponds. Two villages were selected randomly from each block for the study. For the study, a total of 16 villages were drawn randomly. Twenty (20) respondents from each village, including farm pond beneficiaries and non-beneficiaries were selected randomly. Around 80 respondents from one district were selected, making a total of 320 respondents from four selected districts constitute the sample. A structured schedule for data collection was used to assess changes in agricultural activities and farm pond practices. Assessed through the livestock composition index, women productive time utilization ratio (WPTUR), regular employment generation index (REGI), irrigability index (II), cultivated land utilization index, enterprise cost-effectiveness index,and cumulative cube root frequency(Sharda *et al.*, 2012).

RESULTS AND DISCUSSIONS

The data related to major changes in the activities of farm pond owners is presented in Table1. The result found that all major activities of farm pond owners changed after the adoption of farm pond, it is also observed that women's productive time utilization index,

Comment [HX3]: briefly explain the steps of this method, especially in providing values, such as tables 1, 2, etc

regular employment generation index, livestock composition index, enterprises cost-effectiveness index, cultivated land utilization index, and irrigability index were found significant (1 % level of probability). These findings are in line with a study done by Chowdary and Meghana (2019).

Table 1: Major Changes in Activities of Beneficiary after Adoption of Farm Pond (n=160)

S. No.	Indicators	Before farm pond Mean score	After farm pond Mean score	Index value	t value	P>t
1.	Women's productive time utilization index	0.43	2.47	2.47	-18.58	.000***
2.	Regular employment generation index	81.54	151.04	185.23	-30.26	.000***
3.	Livestock composition index	1.46	2.39	2.39	-5.67	.000***
4.	Enterprises cost-effectiveness index	17.27	48.83	9.31	-33.15	.000***
5.	Cultivated land utilization index	0.22	0.67	0.67	-38.73	.000***
6.	Irrigability index	2.17	16.88	6.27	-33.52	.000***

*** 1% level of probability

The adoption of farm ponds has led to profound and statistically significant improvements in various aspects of beneficiary activities. Notably, there was a substantial increase in women's productive time utilization, empowering them to engage more effectively in productive activities. Additionally, farm ponds have become catalysts for job creation and income generation, contributing to economic well-being. Furthermore, improvements in livestock composition, enterprise cost-effectiveness, cultivated land utilization, and irrigability index underscore the multifaceted benefits of farm pond adoption, enhancing agricultural productivity and resource utilization. The study is in line with Anantha, *et al.* (2021); Vinchurkar & Ingole (2021) and Ghungarde, D. S. (2021). The similar findings were noted by Gowda & Sathish (2011); Kiresure *et al.*, (2017); Babu *et al.* (2019); Harikrishna *et al.* (2019); Mondal *et al.* (2020); Jakkawad *et al.* (2020) and Jakhar *et al.* (2022).

The major changes in agriculture activities of farm pond owners are classified according to cumulative cube root frequency method (CCFM) and are given in Table 2. According to CCFM, in the women's productive time utilization index, it is found that the majority of the respondents (45.63 %) were observed in the medium category followed by low (35.63 %) and high category (18.75 %), respectively. In the regular employment generation index, it is found that the majority of respondents (45.63 %) were observed in the low category followed by medium (37.50 %) and high category (16.88 %), respectively. In the case of the livestock composition index, it is found that the majority of respondents (62.50 %) were observed in the low category followed by medium (21.88 %) and high category (15.63 %), respectively. In the enterprise's cost-effectiveness index, it is found that the majority of respondents (46.25

Comment [HX4]: collect each discussion into a separate sub-chapter as a discussion

) were observed in the medium category followed by the high (31.25 %) and low category (22.50 %). In the case of the cultivated land utilization index, it is found that the majority of respondents (45 %) were observed in the high category followed by medium (35.63 %) and low category (19.38 %), and in the irrigability index majority respondents (53.13 %) were in medium category followed by low (27.50 %) and high category (19.38 %), respectively.

Table 2: Categorization of Beneficiary Based on Cumulative cube root frequency method (n=160)

S. No.	Index	Low	Medium	High
		%	%	%
1.	Women's productive time utilization index	35.63	45.63	18.75
2.	Regular employment generation index	45.63	37.50	16.88
3.	Livestock composition index	62.50	21.88	15.63
4.	Enterprises cost-effectiveness index	22.50	46.25	31.25
5.	Cultivated land utilization index	19.38	35.63	45.00
6.	Irrigability index	27.50	53.13	19.38

Utilization Pattern of Agriculture Income by the Farm Pond Owners

A glance at Table 3 showed that majority of beneficiaries has allocated their income for essential agricultural purposes, with 56.88 per cent directed towards farm inputs like fertilizers, seeds, and pesticides. Furthermore, 18.13 per cent invested in farm equipment, emphasizing improved agricultural productivity and efficiency. A smaller fraction (2.50%) was used for personal reasons, such as family functions, while 5.00 per cent was invested in purchasing cattle, indicating income diversification. Additionally, 7.50 per cent was used to repay moneylenders, and 3.75 per cent is allocated for repaying old debts to banks, reflecting financial obligations in the agricultural sector. A minor portion (1.25%) is utilized to purchase land, possibly for expansion or investment, while another 1.25 per cent is designated for non-agricultural businesses. A similar percentage lends their income to others, supporting local economic activities. Lastly, 2.50 per cent of beneficiaries have specified other purposes for their income, demonstrating individual preferences and diverse needs, aligning with the findings of the study. Ghule, *et al.* (2012) and Ghodake & Khedkar (2020). The agriculture farm pond incomes primarily serve the needs of the agricultural sector, with a significant emphasis on inputs and equipment. However, it also plays a role in the personal and financial aspects of beneficiaries' lives, showcasing the multifaceted nature of agricultural income in rural livelihoods.

Comment [HX5]: collect each discussion into a separate sub-chapter as a discussion

Table 3: Utilization Pattern of Farm Pond Income by the Beneficiary (n=160)

S. No.	Utilization of Agriculture Income	%
1.	To purchase farm inputs (fertilizers, seeds, pesticides, etc.)	56.88
2.	To purchase farm equipment (e.g., tractor, thresher)	18.13
3.	For family function	2.50

4.	To purchase cattle	5.00
5.	To return money to a moneylender	7.50
6.	To return the bank's old debt	3.75
7.	To purchase land	1.25
8.	For non-agricultural business	1.25
9.	To lend out to others	1.25
10.	Other (specify)	2.50

Investment in Farm Component by Farm Pond Owners

The data related to investment in farm pond components by beneficiary is depicted in Table 4. The results found that a majority of the farm pond owners' investment in horticultural crops with a mean score of 401 followed by investment in animal husbandry (MS 360), investment in the agricultural crop (MS 236), investment in maintenance cost of farm pond (MS 136) and investment on food (MS 132). The study is in line with Ghule, *et al.* (2012); Ranaware *et al.* (2015) and Ghodake & Khedkar (2020).

The categorization of investment on farm component by farm pond owners, according to the cumulative cube root frequency method, investment on food items found that the majority of respondents (48.75 %) were observed in low category followed by medium (27.50 %) and high category (23.75 %), respectively. In investment agriculture revealed that the majority of respondents (45 %) were observed in the medium category followed by the low (41.25 %) and high category (13.75 %), respectively. Regarding investment in horticultural crops, 48.12 per cent were observed in the medium category followed by the high (31.87 %) and low category (20 %), respectively. In the case of investment in animal husbandry (livestock & fishery), a majority of respondents (48.75 %) were observed in the low category followed by the medium (40 %) and high category (11.25 %). In addition, in the maintenance of the farm pond, the majority of respondents (55 %) were observed in the low category followed by medium (33.12 %) and high (11.88 %), respectively.

Change in Livelihood Component of Farm Pond Owners

The change in the livelihood component of farm pond owners was analysed and is presented in Table5. The result related to the overall change in the livelihood component of farm pond owners after the adoption of farm ponds was found significant change with a mean score of 84.09. Among livelihood components employment component had the highest mean score i.e 81.33 followed by the economic component (MS 75.97), material component (MS 68.78), social component (MS 66.38), and general component (MS 49.56) of the farm pond owners. These findings are in line with Johnson *et al.* (2013); Venu *et al.* (2015); Ranaware *et al.* (2015); Deshmukh *et al.* (2017); Harikrishna *et al.* (2019) and Anantha, *et al.* (2021).

Comment [HX7]: collect each discussion into a separate sub-chapter as a discussion

Table 5: Change in Livelihood Component of Beneficiary after Adoption of Farm Pond (n=160)

S. No.	Livelihood Component	Mean Score
1.	General component	49.56
2.	Economic component	75.97
3.	Social component	66.38
4.	Material component	68.78
5.	Employment component	81.33
6.	Overall component	84.09

The change in the livelihood component of farm pond owners is classified according to the cumulative cube root frequency method (Table6). It is found that the majority of respondents (42.50 %) were observed in the low category followed by medium (40.63%) and high category (16.87%) of change in the livelihood of farm pond beneficiaries.

Table 6: Categorization of Beneficiary According to the Cumulative cube root frequency method (n=160)

S. No.	Category	CCRF Score	f	%
1.	Low	< 82.62	68	42.50
2.	Medium	82.62 – 86.28	65	40.63
3.	High	> 86.28	27	16.87

Extension Interventions for Successful Utilization of Farm Ponds:

The following extension interventions have been suggested for successful utilization of farm ponds:

- The state should promote farm pond technology adoption among non-beneficiary farmers to maximize irrigation potential and increase crop yields per drop.
- Prioritize the continuation of the farm pond program, focusing on small and marginal farmers due to its positive economic and social impact.

- Re-evaluate subsidy distribution, giving more emphasis to assisting marginal and small farmers to minimize losses from land allocation for farm ponds.
- Regulate groundwater extraction for storage in agricultural ponds in officially designated exploited watersheds and water scarcity zones.
- Include provisions for controlling the quantity and size of agricultural ponds based on geographical variables in each village within the farm pond program.
- Collaborate with local institutions or non-governmental organizations to develop sustainable alternatives to plastic linings in agricultural ponds, supported by state extension agencies.
- Mandate efficient irrigation methods like drip and sprinkler systems for farm pond beneficiaries to enhance crop yields and increase subsidies for such practices.
- Promote integrated farming systems that encompass horticulture, livestock, and fisheries components to improve long-term revenue and resource efficiency.
- Establish community platforms in each village to facilitate knowledge exchange, resource mobilization, and technology utilization.
- Implement geo-tagging and monitoring of farm ponds every 3 to 5 years, and provide financial support for maintenance and construction, while also encouraging direct marketing, mechanization, and ongoing program improvement for the economic well-being of farm pond beneficiaries.

CONCLUSION:

The study unequivocally demonstrates the transformative impact of farm pond adoption on the livelihoods of beneficiaries in drought-prone regions of Maharashtra, India. All major activities of farm pond owners exhibited significant changes after adoption, and these changes were highly statistically significant at the 1% level. Notably, the increase in the women's productive time utilization index underscores the gender-empowering effects of farm ponds, enabling more effective engagement of women in productive activities. The substantial rise in the regular employment generation index reflects farm ponds' pivotal role in job creation and income enhancement for beneficiaries. Furthermore, improvements in livestock composition, enterprises' cost-effectiveness, cultivated land utilization, and irrigability index highlight the multifaceted benefits of farm pond adoption, including enhanced agricultural productivity and resource utilization. The utilization pattern of agriculture income by farm pond owners demonstrates a judicious allocation of income primarily towards agricultural needs, with a notable focus on inputs and equipment. The investments in various components indicate a strong emphasis on horticultural crops and animal husbandry, reinforcing the diversification of income sources among beneficiaries. Therefore, the findings of the study underscore the significance of sustainable water management practices in addressing the challenges of agriculture and livelihood enhancement in drought-prone regions for significant changes in the livelihood components of farm pond owners.
