

### **Editor's Comment:**

Despite positive reviews, I believe that the article in its current form cannot be published because it requires many additions to the methodology. The standard in scientific publications is to describe the methodology in such a way that the experiment can be repeated on its basis:

- the procedure for extracting the tested material should be described in detail or the authors should cite an appropriate literature source,
- the determination of phytochemical components in the extract should be described in detail or the authors should cite an appropriate literature source, so far the authors have stated that are standard methods, but it is completely unclear which ones?
- Atwater coefficients are missing units,
- colorimeter data is missing when analyzing minerals,
- the work lacks Table 3 to which the authors refer in the text,
- Tables 2, 4, 5 – in what units are these values given?
