

Editor's Comment:

I read the manuscript and it is not a research article

1. Hypothesis test is not to obtain significance, it's only to probe a hypothesis
2. 20 students as sample test is very poor to obtain a good mathematical and statistical data to make better analysis
3. The data only showed quality preferences
4. The discussion section is very poor
5. Which is the nutritional value of the bread? Can calcium from shrimp shells be used in human physiology?
6. Humans only need 1 g day⁻¹ of calcium. The authors do not mention anything about final calcium concentration in one slice white bread or how many bread slices need to reach that concentration, because they can introduce more calcium in human organisms and provoke a disease.
