

# MANAGEMENT OF POD BUGS IN COWPEA (*Vigna unguiculata* L.) ~~APPLYING THROUGH~~ ECO-FRIENDLY INSECTICIDES

Formatted: Font: Not Italic

## ABSTRACT

Investigation on ~~the~~ management of pod bugs in cowpea (*Vigna unguiculata* L.) ~~using through~~ eco-friendly insecticides was carried out during ~~the~~ kharif ~~season in~~ 2018 at dry land farm, S.V. Agricultural College, Tirupati. The results revealed that ~~neem seed kernel extract~~, NSKE @ 5 ~~per cent~~ percent was found to be the most effective in reducing pod bugs population with highest mean ~~per cent~~ percent reduction over the control, lowest ~~per cent~~ percent pod damage (39.57%), seed damage (27.33%), highest ~~hundred gram~~ hundred-gram grain weight (12.0 gm) and the highest grain yield (933 kg-ha<sup>-1</sup>) followed by spinosad @ 0.2 ml/l and neem oil @ 0.5 ~~per cent~~ percent. ~~Therefore, it might~~ would be ~~better to~~ suggested ~~that~~ NSKE @ 5 ~~per cent~~ percent can be applied for the better management of pod bugs in cowpea.

## INTRODUCTION

Cowpea (*Vigna unguiculata* L.) is one of the most important pulse crops ~~which~~, native to central Africa, ~~and~~ belongs to ~~the~~ family Fabaceae. Cowpea is called as vegetable meat due to ~~the~~ high amount of protein in grain with better biological value on ~~a~~ dry weight basis. In recent years pod bugs ~~are have been~~ a real threat to quality grain production in ~~cowpea~~ cowpeas. Among the Pod bugs, *Riptortus pedestris* (Fabricius) (Heteroptera: Coreidae), and *Clavigralla gibbosa* Spinola (Hemiptera: ~~Coreidae~~ ~~are~~ Coreidae) are the most destructive of leguminous crops, ~~desap~~ tender shoots and pods of cowpea leads to ~~the~~ damage to pods and seeds ~~up to~~ up to 60 to 70 percent (Krishna *et al.*, 2005). Damaged seeds ~~usually~~ further do not germinate and are not acceptable for human consumption (Shanower *et al.*, 1999).

~~The chemical~~ **Chemical** insecticides have ~~been~~ found to be effective in controlling the pod ~~and~~ pest complex. However, indiscriminate use of chemicals ~~lead~~ leads to ~~the~~ problems like pest outbreak, development of insecticide resistance by pests, elimination of natural enemies ~~including~~ predator (Mollah *et al.*, 2012) and parasitoids (Mollah and Khatun, 2023) and risk to human and animal health besides environmental pollution. So, now it is high time to think of ~~those~~ strategies ~~which~~ that are eco-friendly and environmentally safe to manage the pests efficiently. ~~Some eco-friendly insecticides have already been found effective against brinjal shoot and fruit borer, *Leucinodes orbonalis* G. (Mollah *et al.*, 2023; Mollah *et al.*, 2022a). Some non-toxic entomopathogenic bacterial metabolites were also found effective against the diamondback moth, *Plutella xylostella* Lin. (Mollah, 2024) and fall armyworm, *Spodoptera exigua* Hub. (Mollah *et al.*, 2020). In the country bean field Neem Oil found effective against bean pod borer, *Maruca testulalis*~~

Formatted: Font: Italic

G. (Mollah et al., 2012), bean aphid, *Aphis craccivora* Koch (Mollah et al., 2013), bean bug, *Riptortus pedestris* Fab.), hairy caterpillar, *Spilosoma obliqua* Walk., and stink bug complex (Mollah et al., 2022b; Mollah et al., 2017). These above finding reveals that eco-friendly and bioinsecticides can effectively control the insect pests of crops. Keeping this in view, the present study was undertaken to evaluate the efficacy of ~~some eco-friendly~~ eco-friendly insecticides against pod bugs in the cowpea ecosystem.

## MATERIAL AND METHODS

~~Field~~ The field trial was conducted with popular cowpea variety (TPTC-29) during the kharif 2017-18 at Dryland farm, S.V. Agricultural College, Tirupati to evaluate the efficacy of ~~eco-friendly~~ eco-friendly insecticides against pod bugs. The experiment was laid out in a randomized complete block design with eight treatments including untreated control and replicated thrice. The size of the individual plot was 5 m x 4 m with spacing of 45 cm between the rows and 10 cm between the plants. All the recommended package of practices was adopted in managing the crop to maintain a good crop stand. Treatments viz T1: NSKE 5-%, T2:- Neem oil 0.5-%, T3 : *Beauveria bassiana* 1.0 g/l, T4:- *Metarhizium anisopliae* 1.0 g/l, T5:- Novaluron 1.0 ml/l, T6:- Spinosad 45 SC 0.2 ml/l, T7:- Emamectin benzoate and T8:- -control (water spray only) were applied.

Formatted: Font: Not Italic

Fig.1. Field view of the experiment for the ~~on~~ management of pod bugs in ~~cowpea~~ cowpeas through eco- friendly techniques

Insecticides were applied twice, one at flowering (55\_DAS) and another at the podding podding stage (70DAS) using battery operated knapsack sprayer. Spraying was done during morning hours with care to prevent the drift of the spray fluid from reaching the adjacent plots by keeping a screen in between the plots. Pest population was recorded by observing five randomly selected plants from each treatment at one day prior to insecticide application and one, three, five and seven days after each application. Percent reduction of pod bugs in treatment over control plots was estimated by using the following formula supported by Abbot (1925).

Population reduction over control (%)

$$= \frac{\text{Population in untreated check} - \text{Population in treatment}}{\text{Population in untreated check}} \times 100$$

Population in ~~the~~ untreated check

Commented [WU1]: Make this equation like the next one (percent pod damage)

### Pod damage

The observations on pod damage ~~was-were~~ recorded on five randomly selected plants in each treatment. Pods ~~which-that~~ are shrunken, deformed, and ~~shrivelled-shriveled~~ were considered as ~~damaged-damaged~~ pods. The per cent pod damage was worked out by using following formula.

$$\text{Per cent pod damage} = \frac{\text{Number of damaged pods}}{\text{Total no. of pods}} \times 100$$

### Seed damage

The pods harvested from five randomly selected plants in each treatment were dehusked and the obtained seeds were segregated into healthy and damaged seeds. Seeds which were shrivelled, shrunken and malformed were considered as damaged seeds. The per cent seed damage was estimated based on number of seeds damaged by pod bugs in a pod by using the formula.

$$\text{Per cent seed damage} = \frac{\text{Number of damaged seeds}}{\text{Total no. of seeds per pod}} \times 100$$

Weight of 100 grains collected randomly from each treatment was recorded. The data on grain yield was recorded from the net plot of each treatment separately and converted to per hectare for statistical analysis. The documented data was transformed into necessary transformation and subjected to ANOVA and DMRT analysis for evaluating the relative efficacy of different treatments over the control.

## RESULTS AND DISCUSSION

### *Riptortus pedestris*

#### First spray:

The pre-treatment count at one day before spraying showed that, the mean number of nymphs and adults ~~per plant~~ of *R. pedestris* on cowpea in all the experimental plots ranged from 5.67 to 8.00 bugs per plant which was more or less uniform.

At one day after spraying (DAS), the highest ~~per-centpercent~~ reduction over control was recorded in NSKE @ 5 ~~per-centpercent~~ (59.72%) followed by spinosad @ 0.2 ml/L (48.52%), neem oil @ 0.5 per-cent (40.28%), *Metarhizium anisopliae* @ 1.0 g/l (30.16%), novaluron @ 1.0 ml/l (29.44%), ~~emamectinEmamectin~~ benzoate @ 0.2g/l (21.56%) and *Beauveria bassiana* @ 1.0 g/l (20.44%) (Table 1). At ~~thiedree~~ DAS the highest per-cent reduction over control was recorded in NSKE @ 5 per-cent (75.20%) followed by spinosad 45SC @ 0.2 ml/l (56.67%), neem oil @ 0.5 per cent (50.00%), *Metarhizium anisopliae* @ 1.0 g/l (45.62%), novaluron @ 1.0ml/l (38.61%), *Beauveria bassiana* @ 1.0 g/l (35.56 %) and ~~emamectinEmamectin~~ benzoate @ 0.2 g/l (25.26%) (Table 1). At ~~fifthve~~ DAS, The highest per-cent reduction over control was recorded in NSKE @ 5 per-cent (65.4%) followed by spinosad @ 0.2 ml/l (55.17 %), neem oil @ 0.5 per-cent (46.75%),

Formatted: Font: Bold

Formatted: Font: Not Italic

Formatted: Font: Bold

*Metarhizium anisopliae* @1.0 g/l (39.03 %), novaluron @ 1.0 ml/l (30.83%), *Beauveria bassiana* @ 1.0 g/l (29.31%) and emamectin benzoate @ 0.2 g/l (21.52 %) (Table 1). At seventh DAS, the highest per-cent reduction over control was recorded in NSKE @ 5 per-cent (79.50%) followed by spinosad @ 0.2 ml/l (67.78%), neem oil @ 0.5% (54.67%), *Metarhizium anisopliae* @ 1.0 g/l (44.00%), *Beauveria bassiana* @ 1.0 g/l (35.11%), novaluron @1.0 ml/l (30.33%) and emamectin benzoate @ 0.2 g/l (23.52%) (Table 1).

When the overall efficacy of the first spray against *R. pedestris* was considered, NSKE @ 5 per-cent was found to be the best treatment by recording the highest mean per-cent reduction over control (69.97%) followed by spinosad @ 0.2 ml/l (57.03%) and neem oil @ 0.5 per-cent (47.92 %). The next treatments in the descending order of efficacy were *Metarhizium anisopliae* @ 1.0 g/l (39.70%), novaluron @ 1.0 ml/l (32.31%) *Beauveria bassiana* @ 1.0 g/l (30.11%) and emamectin benzoate @ 0.2 g/l (22.97%) (Table 1).

## Second spray

The pre-treatment count at one day before spraying showed that the mean number of nymphs and adults per plant of *R. pedestris* on cowpea in all the experimental plots ranged from to 8.67 to 10.00 bugs per plant which was more or less uniform.

At one DAS the highest per-cent reduction over control was recorded in NSKE @ 5 per-cent (61.31%), followed by spinosad @ 0.2ml/L (48.15%), neem oil @ 0.5 per-cent (40.65%), *Metarhizium anisopliae* @ 1.0 g/l (32.50%), *Beauveria bassiana* @ 1.0 g/l (26.15%), novaluron @ 1.0 ml/l (24.00%) and emamectin benzoate @ 0.2 g/l (18.10%) (Table 1). At three, 3DAS, 5DAS and at 7 DAS almost all same line of trend in mean per-cent reduction over control was observed. The order of effectiveness of these treatments was NSKE @ 5 per cent > spinosad @ 0.2 ml/l > neem oil @ 0.5 per cent > *Metarhizium anisopliae* @ 1.0 g/l > novaluron @ 1.0 ml/l > *Beauveria bassiana* @ 1.0 g/l > emamectin benzoate @ 0.2 g/l (Table 1).

When the overall efficacy of second spray against *R. pedestris* was considered, NSKE @ 5 per cent was found to be the best treatment by recording the highest mean per cent reduction over control (64.17%) followed by spinosad @ 0.2 ml/l (54.54%) and neem oil @ 0.5 per cent (47.29%). The next treatments in the descending order of efficacy were *Metarhizium anisopliae* @1.0 g/l (36.91%), novaluron @1.0 ml/l (29.17%) *Beauveria bassiana* @ 1.0 g/l (29.63%) and emamectin benzoate @ 0.2 g/l (21.86%) (Table 1)

**Nymph**

**Adult**

**Figure-2. *Riptortus pedestris***

Formatted: Font: 13 pt

### ***Clavigralla gibbosa***

#### **First spray:**

The pre-treatment count at one day before spraying showed that the mean number of bugs/plant (*Clavigralla gibbosa*) on cowpea in all the experimental plots ranged from 7.67 to 10.50 bugs per plant which was almost more or less uniform.

At one DAS, the highest per-cent reduction over control was recorded in NSKE @ 5 per cent (53.33%) followed by spinosad @ 0.2 ml/l (43.39%), neem oil @ 0.5 per cent (38.43%), novaluron @ 1.0 ml/l (30.83%), *Metarhizium anisopliae* @ 1.0 g/l (29.44%), emamectin benzoate @ 0.2 g/l (21.56%) and *Beauveria bassiana* 1.0 g/l (20.44%) (Table 2). At three 3DAS, 5DAS, and at 7 DAS almost all the same line of trend in mean per cent reduction over control was observed. The order of effectiveness of these treatments was NSKE @ 5 per cent > spinosad @ 0.2 ml/l > neem oil @ 0.5 per cent > *Metarhizium anisopliae* @ 1.0 g/l > novaluron @ 1.0 ml/l > *Beauveria bassiana* @ 1.0 g/l > emamectin benzoate @ 0.2 g/l (Table 2).

Formatted: Font: Bold

Formatted: Font: Bold

When the overall efficacy of first spray against *C. gibbosa* was considered, NSKE @ 5 per cent was found to be the best treatment by recording the highest mean per-cent reduction over control (69.79%) followed by spinosad @ 0.2 ml/l (60.85%) and neem oil @ 0.5 per-cent (51.85%). The next treatments in the descending order of efficacy were *Metarhizium anisopliae* @ 1.0 g/l (41.39%), novaluron @ 1.0 ml/l (40.21%) *Beauveria bassiana* @ 1.0 g/l (34.72%) and emamectin benzoate @ 0.2 g/l (24.19%) (Table 2).

Formatted: Font: Bold

### Second spray:

The pre-treatment count at one day before spraying showed that the experimental plots ranged from 8.00 to 10.7 bugs per plant which was more or less uniform.

At one DAS the highest per cent reduction over control was recorded in NSKE @ 5 per-cent (54.23 %), followed by spinosad @ 0.2ml/L (44.81 %), neem oil @ 0.5 per-cent (35.83%), *Metarhizium anisopliae* @ 1.0 g/l (33.97%), novaluron @ 1.0 ml/l (24.00%) *Beauveria bassiana* @ 1.0 g/l (26.15%), and emamectin benzoate @ 0.2 g/l (18.10%) (Table 2). At three 3DAS, 5DAS, and at 7 DAS almost all the same line of trend in mean per cent reduction over control was observed. The order of effectiveness of these treatments was NSKE @ 5 per cent percent > spinosad @ 0.2 ml/L > neem oil @ 0.5 per cent percent > *Metarhizium anisopliae* @ 1.0 g/l > novaluron @ 1.0 ml/l > *Beauveria bassiana* @ 1.0 g/l (26.00%) > emamectin benzoate @ 0.2 g/L (18.67%) (Table 2).

When the overall efficacy of second spray against *C. gibbosa* was considered, NSKE @ 5 per-cent was found to be the best treatment by recording the highest mean per cent reduction over control (67.38%) followed by spinosad @ 0.2 ml/l (57.27%) and neem oil @ 0.5 per-cent (47.92%). The next treatments in the descending order of efficacy were *Metarhizium anisopliae* @ 1.0 g/l (41.24%), novaluron @ 1.0 ml/l (37.68%), *Beauveria bassiana* @ 1.0 g/l (27.20%) and emamectin benzoate @ 0.2 g/l (21.85%) (Table 2). The present findings are conformity with Srinivas (2010) reported that the highest per cent reduction (66.1 %) in population bugs over control was observed in NSKE 5% this may be due to affect egg laying and egg hatching influencing the production percentage of young one. The ovipositional deterrence might be mainly due to the strong odour of the products and ovicidal activity due to interference with the embryonic development within the egg (Venugopala Rao *et al.*, 2005).

### Yield parameters:

#### Pod damage:

The ~~per cent~~percentage of pod damage inflicted by pod bugs on ~~cowpea~~ cowpeas in experimental plots during ~~kharif~~ Kharif 2018 ranged from 39.57 to 83.33 ~~per cent~~percent. The least per cent pod damage was recorded ~~due to~~ NSKE @ 5 ~~per cent~~percent (39.57%) followed by spinosad @ 0.2 ml/l (47.49%), neem oil @ 0.5 ~~per cent~~percent (49.14%), *Metarhizium anisopliae* @ 1.0 g/l (50.45%), novaluron @ 1.0 ml/l (51.00%), *Beauveria bassiana* @ 1.0 g/l (53.45%) and ~~emamectin~~Emamectin benzoate @ 0.2 g/l (58.73%). The untreated control recorded the highest ~~per cent~~percent pod damage (83.33%) (Table 3).

Formatted: Font: Bold

#### Seed damage:

The per cent seed damage inflicted by pod bugs on cowpea in experimental plots during kharif 2018 ranged from 27.33 to 63.28 per cent. The lowest per cent seed damage was recorded in NSKE @ 5 percent (27.33 %), followed by spinosad @ 0.2ml/l (29.81 %), neem oil @ 0.5 per cent (37.56%), ~~Metarhizium anisopliae~~*Metarhizium anisopliae* @ 1.0g/l (37.89 %), novaluron @ 1.0 ml/l (44.65%), *Beauveria bassiana* @ 1.0 g/l (48.77 %) and ~~emamectin~~Emamectin benzoate @ 0.2 g/l (48.93 %). The untreated control recorded the highest per cent seed damage (63.28%) (Table 3). The present findings similar with Nara

Formatted: Font: Bold

#### 100 grain weight:

The present study revealed that, all the treatments recorded higher 100 grain weight, compared to untreated control. The treatment NSKE @ 5 per cent recorded the maximum 100 grain weight 12 g, followed by spinosad @ 0.2 ml/l (11.00g), neem oil @ 0.5 per cent (8.60g), *Metarhizium anisopliae* @ 1.0g/l (7.60 g), novaluron @ 1.0 ml/l (7.40 g), *Beauveria bassiana* @ 1.0 g/l (7.10g), ~~emamectin~~Emamectin benzoate @ 0.2 g/l (7.06 g) and untreated control (7.00 g) (Table 3).

Formatted: Font: Bold

#### Grain yield:

The data revealed that all the treatments had higher grain yield, compared to untreated check. The treatment NSKE @ 5 ~~per cent~~percent recorded the maximum yield of 933.33 kg ha<sup>-1</sup>, followed by spinosad @ 0.2 ml/l (850 kg ha<sup>-1</sup>), neem oil @ 0.5 per cent (736.66 kg ha<sup>-1</sup>), *Metarhizium anisopliae* @ 1.0 g/l (680 kg ha<sup>-1</sup>), novaluron @ 1.0 ml/l (670 kg ha<sup>-1</sup>), *Beauveria bassiana* @ 1.0 g/l (590 kg ha<sup>-1</sup>) and ~~emamectin~~Emamectin benzoate @ 0.2 g/l (546.6 kg ha<sup>-1</sup>) while untreated check recorded yield of 523.3 kg ha<sup>-1</sup> (Table 3).

Formatted: Font: Bold

Similar results were reported by Singh and Nath (2011) who reported that ~~eco friendly~~eco-friendly bio-pesticides viz., (NSKE 5%, *Bt*, and nimbecidine) had significant influence on the reduction of grain weight loss by pod bugs. The average grain weight loss was minimum in the plots treated with two sprays of NSKE @ 5 per cent as compared with untreated control, which

exhibited the maximum grain weight loss during both the years. And ~~also~~, agreement with Kalyan *et al.* (2017) also reported NSKE 5% has higher per cent reduction in population of sucking pests compare to entomopathogenic fungi in cotton. Similarly, Vinodhini and Malaikozhundan (2010) found neem seed kernel extract (5%) was most effective in reducing the population of sucking pests in cotton. Possession of antifeedant property against sucking pests by neem was proved earlier by (Abdulai *et al.* 2003 and Dutta *et al.* 2013)

In present finding after the NSKE next best treatment is spinosad 45 SC @ 0.2ml/L in terms of pest population in 1, 3, 5, 7 days after spraying and also per cent pod damage, per cent seed damage, 100 grain weight and yield. The present findings conformity with Dahal *et al.* (2020) reported that the highest per cent reduction (53.3%) of pod bugs over the control was observed in spinosad treated plot. The present findings similar with (Narasimha murthy and keval 2013) reported ~~that plot~~ that plot treated with spinosad 45% SC showed minimum (8.30%) pod damage and 2.36% grain damage by pod ~~bug and~~ higher grain yield 1625 kg/ha.

## SUMMARY AND CONCLUSION

The results of the field experiment on ~~the~~ evaluation of certain eco-friendly insecticides against pod bugs on cowpea revealed that, all the insecticide treatments tested were effective in ~~the~~ management of pod bugs than the untreated control. At seven days after the second spray, the highest ~~per cent~~ reduction of pod bugs over the control was recorded with NSKE @ 5 ~~per cent~~ followed by spinosad @ 0.2 ml/l, neem oil @ 0.5 ~~per cent~~, *Metarhizium anisopliae* @ 1.0 g/l, novaluron @ 1.0 ml/l, *Beauveria bassiana* @ 1.0 g/l and ~~emamectin~~ Emamectin benzoate @ 0.2g/l. The lowest ~~per cent~~ pod and seed damage inflicted by pod bugs on cowpea ~~was were~~ recorded in the treatment NSKE @ 5 ~~per cent~~ followed by spinosad @ 0.2 ml/l, neem oil @ 0.5 ~~per cent~~, *Metarhizium anisopliae* @ 1.0 g/l, novaluron @ 1.0 ml/l, *Beauveria bassiana* @ 1.0 g/l and ~~emamectin~~ Emamectin benzoate @ 0.2g/l. The highest grain yield and 100 grain weight were recorded in the treatment NSKE @ 5 per cent followed by spinosad @ 0.2 ml/l, neem oil @ 0.5 per cent, *Metarrhizium anisopliae* @ 1.0 g/l, novaluron @ 1.0 ml/l, *Beauveria bassiana* @ 1.0 g/l and ~~emamectin~~ Emamectin benzoate @ 0.2 g/l.

The treatment NSKE @ 5 per cent recorded significantly low pod and seed damage by pod bugs and significantly higher grain yield and 100 grain weight than the other treatments, indicating the superiority of NSKE @ 5 per cent in managing the pod bugs in cowpea.
