

Embracing the Digital Economy: The Emergence of E-Rupee and Its Challenges and Impact on India's Financial Landscape.

Abstract:

The advent of digitisation and digitalisation has revolutionised multiple facets of human society, namely in the domains of economics, finance, and technology. This process has enabled the integration of digital technologies into various daily activities, a concept known as digitalisation. The advancement of technology has led to the emergence of ideas like the digital society and digital economy, digital currencies particularly Central Bank Digital Currencies.

The transition towards an economy that operates without tangible cash is indicated by the use of digital currencies such as e-Rupee and the endeavours of the RBI to establish a Central Bank Digital Currency in Indian context. These developments not only make transactions easier, but also provide benefits such as greater liquidity, financial inclusion, and transparency.

Moreover, the emergence of the 4th Industrial Revolution (4.0), driven by digital technologies, is transforming industries on a global scale. Within the field of agriculture, digitalisation is transforming farming methods by implementing smart farming, precision agriculture, and digital agriculture. Guidelines for mitigating operational risks associated with digital currency may be found in the NIST Risk Management Framework and the CPMI-IOSCO Principles for Financial Market Infrastructures.

Ultimately, the embrace of digital currencies and the digitization of numerous industries have the potential to stimulate economic growth, enhance financial accessibility, and propel technological advancement.

Keywords: Digitization, Digitalization, Digital currency, Central Bank Digital Currencies, RBI, E-Rupee, NIST RMF, CPMI-IOSCO Principles for FMI.

Introduction:

The term "digitization" refers to the procedure by which analog data is converted to digital data (such as images, text, audio, and videos) into a digital format, encoding it for the purpose of storing, processing, and subsequently transmitting the information to the user (Bloomberg, 2018). The integration of digital technologies into routine tasks constitutes digitalization or the digital revolution. It pertains to the transformations that occur across all facets of human societies as a result of digital technology implementation (Bejinaru, 2019).

As information and communication technologies continue to advance and become more prevalent, the concepts of digital society and digital economy are materializing (B Lundqvist, 2017). Nevertheless, digitization and digitalization are not synonymous. It plays a pivotal role in advancing socioeconomic development (J Xu, et al., 2022).

Digitized transactions refer to the implementation of a contractual obligation to transfer actual currency between two accounts, from one owner to another owner. The topic of settlement of inter-account transfers of cash has been thoroughly examined in the literature on payments systems, with a specific focus on the contractual terms and standards involved (Armstrong, M. 2006).

Digital currency integrates the essential attributes of money with the convenience and effectiveness of electronic transactions (Kochergin, et al., 2019), with the bank debit card being a prominent illustration. Nevertheless, the widespread approval of electronic banking transactions has facilitated the development of a distinct forms of e-currency which are not linked either to a bank account nor any conventional means of storing value (S Giannakoudi, et al., 1999). The reliability of digital currency is based on the computer algorithms that govern its creation and distribution (Sarah Allen, et al., 2020).

At first glance, the virtual currency seems to be unsuitable as a reliable function of preserving wealth, since it is merely a form of digital currency (Kubat M, 2015). Although the term "virtual" encompasses more than just the concept of anything being artificially created or projected. In the context of virtual currency like Bitcoin, it signifies that the algorithm responsible for generating units of the currency ensures that its supply remains within a predetermined range (A Judmayer, et al., 2022). The supply limit for Bitcoin is set at 21 million Bitcoins (J Taskinsoy, 2021). This type of digital currency (cryptocurrency) is a form of money that uses computer encryption to keep track of both the supply and the ownership of coins. It is also known as virtual currency.

In economics sense, digital currency is an e-type (electronic) mode of payment which can be done for all the three motives; Transaction, precaution and speculative as well

The term Bitcoin with capital "B" is used when describing the concept of Bitcoin or the entire network itself, while the term bitcoin with lowercase "b" is used to describe bitcoin as a unit of transaction (<https://bitcoin.org/en/vocabulary#bit>)

Comment [2]:

Rephrasing is recommended. Bitcoin, like other cryptocurrencies, uses cryptography to allow transactions to be anonymous and secure, not to keep track of supply and ownership. In reality, it is possible to associate a Bitcoin address with a person or entity, although Bitcoin addresses are pseudonymous by nature due to their alphanumeric character. Centralized crypto exchanges share customer data - including wallet addresses and personal data - with the tax authorities and other agencies.

Also, the supply of Bitcoin is defined algorithmically by its protocol, as it is correctly mentioned above.

Comment [3]:

Rather use the term cryptocurrency instead.

(Keynes,1936). So, they can be used for investment purposes and peer to peer transactions. (Examples: Bit coin, E-rupee).

David Chaum in 1983, was the first to present the notion of digital currency. In 1989, he saw the formation of DigiCash, an electronic currency company he founded in Amsterdam with the purpose of commercializing the ideas he uncovered through his research. They lack in physical counterparts like coins, notes, near money, broader money etc.

It is crucial to thoroughly examine the frameworks and principles established for risk management while establishing a CBDC due to various significant factors. As digital currencies become more important in global financial systems, central banks must prioritise the security and stability of these digital payment infrastructures. The **NIST RMF (Risk Management Framework)** offers a systematic method for evaluating and reducing security and privacy risks linked to information systems. By adhering to the procedures delineated in the NIST RMF, central banks can methodically detect possible weaknesses and enforce suitable measures to protect the confidentiality, integrity, and accessibility of data within CBDC systems (Tarik Hansen and Katya Delak, 2022).

2. Types of digital currency:

There are mainly two types of digital currency discussed in economic business sense (JS Gans, H Halaburda, 2015),(DR Skeie, 2021) , (S Shirai, 2019) , (M Shoaib, et al., 2013) , (P Wong, 2020), (RS Samudrala, et at., 2021).

1. **Centralized Digital currency:** Issued and regulated by central authorities like Government or central Bank, like CBDCs (Central Bank Digital Currencies) (Sarah Allen, et al., 2020). Example India's "E-rupee".

Types of CBDCs:

There are two types of CBDCs discussed with related to Digital currency (Al Shkliar, 2020) , (O Schlotmann, et at., 2021) .

Retail CBDCs: where E-rupee is accessible to all the individuals of the country. According to a 2017 article, along with other financial institutions, the Reserve Bank of India (RBI) allotted around 21,000 crores throughout the year for money management. The e-CNY (digital Yuan) issued by People's Bank of China(PBC) is an illustration for a retail CBDC.

Wholesale CBDCs: where E-rupee is used only by the wholesalers, which are strictly monitored by the RBI. Wholesale central bank digital currency (CBDC) has the potential to streamline the process and facilitate automation (Deloitte, n.d.). The Project Helvetia, a collaboration between the Bank for International Settlements, Swiss National Bank, and SIX, showcases the practical viability of using a wholesale Central Bank Digital Currency (CBDC) to settle tokenized assets. Likewise, the experiments conducted by Banque de France with Central Bank Digital Currency (CBDC) also belong to this group.

1.1. Management of CBDCs:

Management of CBDCs can be done through two types of approaches (C Agudelo, et al., 2020), (J Hu, 1995).

- i. **Unimodal (Single-tier):** In this model of CBDC, only central bank monitors the digital currency.
- ii. **Bimodal (Double-tier):** Digital Currency is issued to the customers by financial institutions or certified intermediaries.

UNDER PEER REVIEW

2. **Decentralized Digital currency:** These are digital currencies that operate on decentralized networks using blockchain technology (Tschorsch, et al., 2018) , (M Raskin, D Yermack, 2018). they rely on a network of computers (nodes) to validate and record transactions. Bitcoin stands as the preeminent illustration of a decentralized cryptocurrency. Nonetheless, a plethora of alternative cryptocurrencies exist, including Ethereum, Litecoin, and Ripple so on and so forth.

As time passes and electronic currency usage increases and technology progresses, central banks are confronted with the decision of whether or not to implement a CBDC in order to bolster their monetary authority. The governing bodies have encountered mounting demands to address the obstacles presented by cryptocurrencies and improve the efficiency of the existing system for making payments(Ward and Rochemont, 2019). The 2008 financial crisis, the emergence of cryptocurrencies, and the decreasing use of cash have generated interest in CBDC.

The main goal of the Bill (Cryptocurrency and Regulation of Official Digital Currency, 2021), is to confer the RBI with the requisite legislative jurisdiction to establish CBDC. The RBI declared on January 25th, 2024 its plan to examine the probable requirement of

commencing a CBDC in India. If deemed necessary, the RBI may investigate strategies to implement the currency.

The gradual evolution of currency from being based on physical commodities to metallic coins, then to paper bills, and finally to digital forms has had a profound impact on the financial environment of India (D Harvey, 2017). E-rupee in India was launched in the budget of year 2022 by Financial Minister Smt. Nirmala Sita Raman in collaboration with the National Health Authority (NHA), the Ministry of Health and Family Welfare (MoHFW), and other associated organisations. The National Payments Corporation of India (NPCI) has launched a cutting-edge digital system known as e-RUPI. (Vikaspedia Domains report, 2022).

With the introduction of BHIM and UPI and the deployment of these digital payment networks in almost every retail setting, the RBI and the Indian government have demonstrated their strong support for digital payments (PIB, May 2023).

The RBI declared in a press conference dated November 29, 2022, that from 01-12-2022, the first retail digital Rupees (eA-R) pilot programme will start functioning. This pilot effort will encompass specific sectors inside a Closed User Group (CUG), comprising of merchants and customers who are actively involved (RBI Annual Report, 2023). An illustration of a digital token that functions as lawful currency is the eA-R. The new currency would be generated in the same denominations as the current paper money and coin money. The distribution would occur via middlemen, such as institutions. The digital wallets that users can store on their mobile devices or other devices and utilize to conduct e-R transactions will be supplied by the partnering institutions (C Moonde, 2023). Transactions between individuals (P2P) and between individuals and merchants (P2M) are both feasible.

As India is growing fast every second and minute towards future, India now ranks 1st in world population parameters with more than 1.486 billion peoples, more the people, more the scarcity, which then comes with the unemployment (disguised mostly), this leads to the pressure on government to utilize this labor force in jobs and also with the consideration of sustaining the environment and resources (D Satterthwaite, 2021). It holds an important point to be noticed for the financial improvement and stability issues of the economy.

3. Economic Impact of Digital Currency:

Comment [5]:

1. Background analysis of Digital Currency:

While it's too early to measure a proper significant impact on physical usage of E-rupee, but it won't replace the old currency and it will add on to the existing ways of transactions, but it may affect the traditional culture of transactions.

Digitalization is the preeminent technological development on a global scale. Technology has evolved into an essential component of human society, serving as a catalyst for progress in numerous socio-economic domains including employment, manufacturing, trade and transportation, education, healthcare, telecommunications, banking and financial services, and environmental protection through the advancement and promotion of green technology (Ha and Thanh, 2022).

Economic development and social behaviour are both positively impacted by the digital revolution. Economic expansion may be stimulated by the increased utilization of digital technologies, (Le Thanh Ha, 2022).

It is anticipated that the RBI's introduction of the Digital Rupee will accelerate money digitization and advance India's cashless economy. The adoption of the digital rupee will revolutionise payment techniques, particularly in the realm of cross-border transactions. Future use cases that are suited to certain market demands are probably going to arise as a result of the digital rupee's development (Tushar Manohar Kotak 2023).

The economy and society may be significantly impacted by the standardization of digital money in banking and commerce; thus, it is crucial to fully understand these impacts before making any decisions (Santosh, Kumar Raj, 2022). In the banking sector, digital money has the potential to lower transaction costs, speed up local and international transactions and provide rural communities greater access to the financial system.

The Indian Prospective (2023) reports that Pallavi M. Kandalkar reveals a substantial increase in the value of the electronic payment market in India, the value increased from 13.93 trillion in 2016 to ₹ 30.00 trillion by 2021.

The widespread acceptance of digital currencies has increased due to the availability of convenient payment mechanisms and user-friendly interfaces (B Sivathanu, 2019), including NEFT, RTGS, credit cards, debit cards, and online banking and the positive perspective is that still this growing population if managed and made useful for country through introducing new ways to acquire jobs and money. Such a way is introducing CBDCs like E-rupee, through which following are benefits:

2. Fourth Industrial Revolution and scope of Digital Currency:

Industrial revolutions are defined as epochs of progressive technology that are distinguished by specific attributes that precipitate more extensive societal changes (Philbeck and Davis, 2019). The United Kingdom experienced the emergence of the 1st Industrial Revolution during the 18th century, which was empowered by steam and mechanized the manufacturing process, resulting in increased output due to enhanced productivity and efficiency. Coal was the predominant energy source. The invention of the internal combustion engine occurred between 1867 and 1914, marking the beginning of the Second Industrial Revolution. During this period, technological infrastructure advanced significantly; for instance, the electricity grid, novel forms of public transportation, the telegraph, and the telephone were invented. Furthermore, synthetic fertilizers laid the foundation for the Industrial Revolution 2.0. With the advent of information technology, the internet, telecommunications, and electronics in the 1960s, the Third Industrial Revolution commenced, ushering in the automation of production.

Digital technologies are essential in enabling universal healthcare, protecting individuals from medical emergencies, and enhancing general health and well-being. They facilitate the

identification of new remedies, support scientific innovations, and aid in the improvement of access to and quality of healthcare services (OCED, 2022). Amidst the COVID-19 pandemic, digitalization and digital health services experienced a notable surge. As a result of mobility restrictions and social distancing measures, the quantity and accessibility of telemedicine's and teleconsultations have significantly increased.

As Agriculture sector is one of the leading and more employment consuming sector in India, the adoption and widespread use of electronic devices in the agriculture sector can help to the sustainable transformation in agricultural systems. Adoption of technologies such as robotics, artificial intelligence, remote sensing image analysis, optical sensors, and monitoring equipment design has enormous potential for sustainable development, according to a growing body of research (UNCTAD 2021; Takeshima and Joshi 2019). The advent of cellular services and high bandwidth in the early 2010s marked the beginning of the virtual revolution in agriculture sector (Bronson and Knezevic, 2016).

Digital agriculture, which integrates the principles of smart farming and precision agriculture with big data analysis, has its roots in the foundations of precision agriculture (Beriya, 2020).

According to a study examining the effects of the digital revolution on agriculture, technological progress has had a significant long-term impact on the agricultural sector.

Agriculture 4.0 possesses the capacity to augment food production, consequently providing sustenance for the expanding global population. Farmers are provided with precise information regarding the timing, location, and application of weedicides and pesticides, as well as optimal irrigation and harvesting practices, through the joining of Internet of Things (IOT) along with sensor-equipped drones (Fountas et al., 2020). Zambon et al. (2019) posit that the implementation of Agriculture 4.0 yields benefits for both producers and the sustained expansion of the primary sector. Farmers' decision-making will be enhanced by the digital revolution in agriculture which is referred by Sponchioni et al., 2021. Farmers can enhance their ability to anticipate and react to unforeseen natural phenomena, such as weather conditions, by utilizing data acquired from remote sensing and IoT devices (German Agricultural Society, 2018).

3. Challenges and Risks involved in Digital currency while implementation:

Numerous potentials for the modernization of the financial ecosystem are presented by the implementation of electronic currencies, such as the proposed e-rupee. The stability and security of the financial system rely on prudent management of the many risks associated with this change. Cybersecurity flaws, financial instability, privacy worries, and difficulties

in monitoring and regulation are some of the major problems that have been surfacing recently in digital currencies as they have gained popularity. While navigating the complexity of adopting a digital monetary system, it is vital for consumers, financial institutions, and lawmakers to understand these dangers. This conversation explores these dangers, drawing attention to the possible drawbacks that come with the advantages of using digital money.

Cybersecurity risks (Hansen T, 2022): Cybersecurity means protecting the data from the malwares and hackers. More the transparency of the money, more the vulnerabilities and this leads to more risk of hackers accessing the personal accounts of individuals.

Financial Instability (RS Samudrala, et at., 2021): When the digital currency circulation increases, the needs of financial institutions like banks decreases as there are less assets to hold now and further banks can't lend to investors of rural areas, where the digital currency is still a myth. Also, the increase in transparency leads to the rational expectations and hence the effectiveness of monetary policies will be lesser (Lucas Papademos theorem, F Modigliani, 1990).

Privacy risks (TJ Hangen, 2022): If there is a well transparency, there occurs privacy issues. As the circulation of e-rupee increases, it will lead to recording in public ledger (decentralized currency), which is the risk to the privacy.

Monitoring and regulating risks (X Li, P Zhou, 2021): it consumes traditional methods of transactions, since India is more affectionate towards tradition and culture, it will be hard to manage the old currency transformation to e-rupee and moreover it involves navigating complex regulatory and legal landscapes.

Fraud and scams: The cybercrime rate in India, measured by the number of registered cybercrime complaints per lakh population in the National Crime Records Bureau (NCRP), was 129 in 2023. (The Times of India, 4 Jan 2024). Increase in digital usage leads to the vulnerabilities and more the fraud and scams.

Technology Access (RS Samudrala, et at., 2021): E-rupee requires a lot of technology advancements, in rural areas the connections of internet are very less, also mainly Indian population belongs to BPL and doesn't fall under tax slabs, so for them to adopt the idea of E-rupee will be very costlier, with slow process.

Lack of privacy and financial exclusion may be exacerbated by CBDC. The main implementation challenges are the hazards associated with technology and CBDC's incapacity to function in an offline environment. With CBDC, anonymity is challenging to achieve and requires careful consideration of private aspects. Instead of depending exclusively on a technological approach, the implementation of CBDC should take sociological, economic, and political variables into account (George Zhu in “Unpacking Central Bank Digital Currency (CBDC) Implementation Challenges and Risks”, 2023).

The digital currency of India, the E-Rupee, resembles a brand-new train. It could stimulate the economy by facilitating quicker, more affordable, and more traceable transactions. The potential for this is to combat corruption and increase participation in the financial system. However, one must first surmount certain obstacles. Rural residents may lack access to or expertise with technology, and there is a possibility of cyberattacks or even government intrusion. Before a broader rollout, the government is presently evaluating the E-Rupee to iron out these kinks.

4. General Guidelines for Risk Management:

While implementing a CBDC, it is crucial for a central bank to prioritise security considerations. Given that a CBDC is built upon information systems, it is advantageous to analyse the risk management measures that provide security in those systems. Introducing a CBDC would include assessing potential dangers and adopting essential measures to efficiently handle and mitigate these risks. The primary areas of risk are typically defined in terms of the possible compromise of data security, availability, authenticity, managed, and shared inside the system. The properties of confidentiality, integrity, and availability, which are commonly referred to as the CIA trinity, are essential security requirements for information systems. Risk management involves enhancing measures so that systems may maintain their CIA (confidentiality, integrity, and availability). There are multiple comprehensive security frameworks that companies can use must ensure the security, reliability, and accessibility of their systems in order to accomplish their goals and commercial activities (Tarik Hansen and Katya Delak, 2022).

NIST RMF (Risk Management Framework):

It is a durable framework designed to efficiently manage and reduce security and privacy risks. It has gained significant popularity among a wide range of public and private organisations. This methodology is highly adaptable and can be seamlessly integrated into any type of information system. It can be tailored to suit the unique needs and risk profiles of any organisation. NIST has created a wide range of accurate standards and recommendations that improve the NIST RMF and provide additional guidance on efficiently managing risk within this framework. The methodology outlined in the NIST RMF is intended to be a continuous and iterative process throughout the entire lifespan of an information system.

CPMI-IOSCO's PFMI (Principles for Financial Market Infrastructure):

Committee on Payments and Market Infrastructures (CPMI) and the International Organisation of Securities Commissions (IOSCO) jointly published global risk-management and related guidelines for payment systems and other financial market infrastructures (FMI) in 2012. These guidelines are regarded as crucial in the context of the PFMI. Key principles that are highly relevant are Principle 2 on governance and Principle 17 on operational risk to the administration of operational risk, encompassing the peril linked to information security.

Table 4.: IOSC principles for financial market infrastructures

Principle	Description
-----------	-------------

Principle 2: Governance	A Financial Market Infrastructure (FMI) ought to be governed by transparent and unambiguous structures that promote the FMI's security and efficacy, preserve the wider financial system stable, deal with other important public interest concerns, and satisfy key stakeholders' goals.
Principle 17: Operational Risk	FMI must factor out the probable origins of operational risk, which can originate from within the organisation or from external factors. It should then minimise the impact of these risks by implementing suitable systems, rules, procedures, and controls. Systems must be developed with the objective of achieving a significant level of security and operational dependability, while also possessing sufficient and adaptable capacity. The primary goal of business continuity management is to guarantee the FMI's responsibilities and the speedy restoration of operations in the face of a severe or extensive interruption .

The table offers further details regarding these two principles. The implementation of PFMI to a CBDC would rely on details of particular implementation and whether it meets the criteria of being a payment system of significant importance as outlined by the PFMI.

Conclusions:

The research outcomes emphasize the profound impact that digital currencies have the capacity to bring about, as best illustrated by the implementation of the E-Rupee in India. With the worldwide adoption of digitalization expanding to encompass diverse sectors, the implementation of digital currency presents unparalleled prospects for promoting financial inclusion, enhancing transaction efficiency and transparency, fostering innovation, and facilitating cross-border transactions. Nevertheless, it is critical to recognize and confront the diverse array of obstacles and hazards that are intrinsic to this shift. These encompass cybersecurity vulnerabilities, financial volatility, privacy apprehensions, intricate regulatory landscapes, and barriers to accessibility, particularly in rural regions. To effectively manage

and ensure the successful implementation of E-Rupee, it is imperative to implement comprehensive regulatory frameworks, conduct regular monitoring, enforce stringent security measures, and ensure effective management. Furthermore, it is critical to achieve a harmonious equilibrium between promoting innovation and preserving financial stability in order to effectively utilize the complete capabilities of digital currency while minimizing potential drawbacks.

The research sheds light on the intricate nature of the path towards establishing a digital currency ecosystem, which necessitates cooperation, ingenuity, and flexibility in order to surmount the challenges and actualize the paradigm-shifting potential of digitalization in the twenty-first century. The E-Rupee holds immense potential to revolutionize the Indian economy. It can promote financial inclusion, streamline transactions, and enhance transparency. However, challenges like digital literacy and cybersecurity threats need to be addressed.
