<p>Optional/General comments</p>	<p>There is impossible reconstruction of climate using mineral composition of sediments. All minerals are at secondary position. For determination of climate conditions as well as transport more useful are \: roundning of grains, size of grains and investigation of morphology of grains of quartz. Determination of amount of kaolinite (%) using X-ray patterns are not OK. Tables are difficult for understanding. Better prepare diagrams using data from lists. Phot. 2 are not velar (is seen nothing), Conclusions are to large.</p>
