

**Editor's Comment:**

I have gone through the revised manuscript and the comments of the reviewers for this fascinating manuscript: " Abnormal Coronary-Bronchial Fistula: The Role of Coronary CT Angiography - A Not So Rare Case Report " for the Asian Journal of Cardiology Research. The manuscript is important for the medical community, especially for the cardiologist, cardiac surgeons, and health care providers in cardiac sciences. Coronary CTA is a valuable tool to diagnose coronary bronchial fistula, which delineates the anatomy well and can also tell the number of fistulas, which in turn is helpful for cardiac surgeons or for an interventional radiologist to plan the therapeutic procedure.

With due consideration the decision on the manuscript titled " Abnormal Coronary-Bronchial Fistula: The Role of Coronary CT Angiography - A Not So Rare Case Report for the Asian Journal of Cardiology Research " is Accepted.
