

Editor's Comment:

The study provide ideas to the scientists regarding characteristics, conditions or things which are going on within the farmers population in the areas under study, and to implement better solutions in terms of adoption of new technologies I farming system for improve quantity and quality of production.

Generally. Statistical test for significant differences on correlation coefficient (r) was not mentioned in the manuscript. It may also better to mention the statistical software used in the analysis of parameters.

The whiting regulations (instruction for authors) may need to be consulted for certain aspects, indicated within the text attached.

it is normal that we use either the name of the author (s) or number the reference in the reference list to refer to the articles cited in the text. I have to say that regarding the t test maybe unrelated but just to refresh that the table for indicating significat difference for r value maybe mentioned too. I think it is well done and can be published.
