# **PARENTING THE ADOLESCENTS AND ITS RELATED FACTORS/PARENTING FOR TODAY'S ADOLESCENTS**

### **Comment [A1]:**

In general, it can be stated that the topic of the manuscript is interesting, but the structure of the manuscript does not follow the goal from a scientific and academic point of view (especially in terms of writing and methodology).

## **ABSTRACT**

This article explores parenting of adolescents in modern times, as the adolescent period is marked by physical, psychosocial and emotional changes such as identity formation, mood swings, peer pressure, experimentation with substances, misunderstandings, and social norm clashes etc. They are more prone to the risky behaviors due to the expanding gap in parent-adolescent closeness and communication. Teenage parenthood can be challenging due to individual differences in biological vulnerability, parenting sensitivity, relationship history, and temperament. Better parenting practices such as honest communication, nonjudgmental attitudes, and emotion regulation can enhance teenage self-confidence, independent decision-making, and communication.

*Keywords: Parenting, adolescent, communication, risky behaviors.*

## **1. INTRODUCTION**

Parenting of adolescents can be extremely difficult as this developmental stage is characterized by substantial physical, emotional, and social changes. The pervasive influence of media and interpersonal connections also can impact adolescents' life [1,2]. Parents are often stressed with the challenges related to sexual and reproductive issues of adolescents such as young pregnancy, motherhood, and incidence of sexually transmitted diseases [3] and also with numerous developmental challenges. Many sociological, environmental, economic, emotional, and health care difficulties such as a lack of parental direction, peer pressure, unequal gender power dynamics, early marriage, insufficient schooling, excessive alcohol and drug use, and low self-esteem contribute to experimentation of early sex and to adolescent pregnancy [4] makes parenting task as challenging.

## **2. CHALLENGES OF PARENTING THE ADOLESCENTS**

Distance between parents and their children may increase as a result of parent-teen conflict, logical and ethical defenses, and the development of values and opinions in adolescents. Parents nowadays find it difficult to strike a balance between raising their children with traditional values and living a modern, hectic life. Some of the challenges reported were:

### **2.1 Communication issues**

Adolescents often become more private and may not communicate as openly with their parents. The family structures and transitions may affect adolescent sexual development especially sexual communication [5]

### **2.2 Technology and Social Media**

Teenagers are less inclined to ask their parents for help these days due to the rapid growth of technology, which makes it harder for parents to provide the essential direction [6].

### **2.3 Identity Formation**

Moreover individual characteristics like biological vulnerabilities, exploration of identities and values may make it more difficult for parents to adopt to the parenting practices such as closeness, support, monitoring, and conflict resolution.[7,8].

### **2.4 Development of health-risk behaviors**

Substance use, early sexual activity, violence, accidents, suicide-related behaviors and mental health issues peaks at this time[9]. These are all significantly linked to reduced parent-adolescent intimacy[10].

### **2.5 Sexual and reproductive health(SRH) issues**

Adolescents with poor behavioral beliefs on SRH issues demonstrated risky sexual behaviors[11]. Increased pre-coital behaviors were reported with an authoritarian parenting style[12]

### **2.6 Peer Pressures**

This is the stage where influences of parents are less and more influence by peers. Adolescents may learn bad habits from peers such as watching pornography and sexual activities from mobile, showing disobedience towards teacher and parents, bullying others, eve-teasing, stealing, cheating, destructing, aggressing, doing risky things or breaking rules, passing on nasty comments, taunting etcmaking parenting a difficult task [13]

### **2.7 Autonomy and independence**

Conflicts can develop between parents and adolescents on rules and boundaries as the adolescents are striving for independence. Adolescents' disobedience is linked to parental divorce, father-grandparent conflict, physical violence, and maternal rejection [14]

### **2.8 Academic pressure**

The adolescents are stressed with their academics. The increased academic pressure may lead to mental health problems such as anxiety and depression, or have suicidal thoughts [15]

## **3 PARENTING STYLES AND ADOLESCENTS' CHARACTERISTICS**

### **3.1 Authoritative parenting**

Authoritative parenting helps to develop self-concept,[16]decreased problematic internet use[17], positive social adjustments, resistance to peer influence as well as lower levels of substance useand is found to be more warm and supportive[18].

### **3.2 Non-authoritative parenting**

Adolescents who perceived their parents as authoritarian had decreased autonomy[19]and more peer problems[20]. A less amount of personal development was experienced by those who believed their parents to be permissive,[19]and both parenting philosophies encourage aggressive and destructive behavior[21].Neglectful and authoritarian parents are reported to have more conflict with their adolescents than indulgent parents[22].**Error! Bookmark not defined.**Adolescent binge drinking[23] and self-harm were highly correlated with lack of emotional warmth from the father, excessive maternal rejection[24], psychological control and reactive control[25].

## **4 RELATIONSHIP BETWEEN PARENTS AND ADOLESCENTS**

Adolescents value the authority, friendship, and emotional support of their parents' relationship[26] Mother-child attachment is linked to emotional experiences, while father-child attachment is linked to emotional coping mechanisms[27].Adolescents become more self-assured and develop self-esteem when their parents and adolescents have an egalitarian relationship[28]. Teenagers with positive parent-child relationships are observed to have fewer depression symptoms[29].Adolescent risky sexual behavior was found to be lower with authoritative parenting styles, high-quality parent-adolescent connections, and parenting that encouraged openness and confidence [11,30,31].Adolescents with authoritative parents reported having the best relationships with both parents, followed by parents who were indulgent, authoritarian, or neglected [22].

#### **4.1 Disagreement between parents and adolescents**

During adolescence, disputes between parents and adolescents are more frequent and serious[28]. Discrepancies between parental concepts and adolescents increased from early to middle adolescence, and those between fathers and their adolescent daughters increased from middle to late adolescence. Parents and children perceive conflict intensity differently, and the degree of the discrepancies is influenced by the personality of the child and the parent[32]. On days when there was disagreement, both parents and teenagers had reduced wellbeing and can lead to depression as well as affect the behavioral autonomy[33,34].

#### **4.2 Communication between parents and adolescents**

Adolescents communicate more openly with their parents, if the family has a healthy emotional climate[35]. Parent-adolescent interactions can be challenging due to social constraints, embarrassment, and poor communication. Cyber victimization and addiction on internet is stronger for adolescents with low parent-adolescent communication[36]. Authoritative parents capable of assessing the severity and susceptibility to engage in sexting activities and the quality of discussion help to recognize the adolescent risk behaviors[37]. Parents need guidance on communication, conflict management, sex, mental health, alcohol and drug use[38] as adolescents preference source of information found to be friends than parents[39].

### **5 MEASURES FOR BETTER PARENTING PRACTICES**

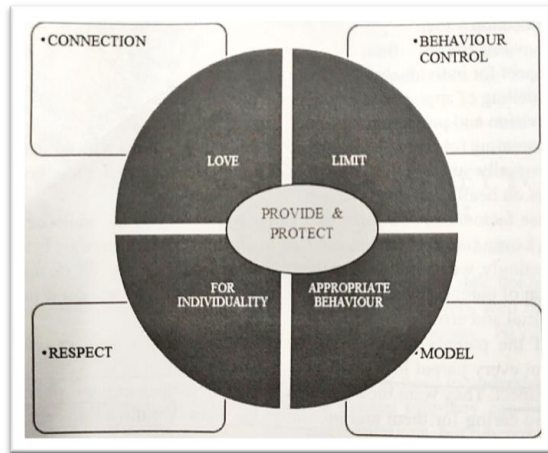

Psychological support group can make parents more confident and enhance communication with their children[40]. Parenting education program showed a rise in authoritative parenting styles and a decline in authoritarian and uncaring ones[41]. Parental education using culturally-appropriate methods[42] and seeking guidance from parenting resources and professionals improved the quality of parenting and lead to less psychological disturbances[43]. Thus parents can exhibit unconditional acceptance in order to be accepted as role models by their children[44].

### **6 DIMENSIONS OF PARENTAL ROLES ON ADOLESCENT HEALTH OUTCOMES**

Parents' roles are organized into five dimensions, each of which has specific influences on adolescents. They are connection, behavior control, respect for individuality, modeling of appropriate behavior, provision and protection. Parents and adolescents' connection need to be made up with behaviors like warmth, affection, care, comfort, concern and nurturance that convey to adolescents that they are loved and accepted. Parental actions should focus on supervising and monitoring adolescents' activities, establishing behavioral rules and consequences for misbehavior, and conveying clear expectations for behavior for shaping or restricting adolescents' behaviors.

Respect for individuality involves allowing the adolescent to develop a healthy sense of self, apart from his or her parents. Acknowledging and permitting this sense of individual worth and identity is important for all adolescents. There are various sets of norms that influence adolescents' actions, depending on the social domain. Parents can become role models for their behaviors and attitudes by providing examples of how to behave in relation to many areas of daily life, including health.

Provision and protection includes the parents' provision of the resources that they can, and seeking out resources when they cannot. It entails efforts by parents to seek out relationships and opportunities within the community that can supplement what the family is able to provide[45].

## 7 BENEFITS OF BETTER PARENTING PRACTICES

### 7.1 Enhance physical, mental, and social wellbeing

Healthy parent-adolescent connections foster healthy teenage growth, improve adolescent-parent relationships, and enhance adolescent communication skills[46,47,48]. Adolescents' improved physical and psychological well-being, moods and emotions, school environment, financial resources[49] and sexual risk-taking behaviors substantially connected with effective parent-adolescent communication[50]

### 7.2 Promote autonomy in learning

Attachment and security between parents and their children predicted improvements in social skills, a decline in delinquency[51], promote adolescent learning and acquiring skills and development of self-esteem. Parental praise and understanding make a special contribution to leadership, goal-setting, teamwork, and overall life skills[52].

### 7.3 Ensure adolescents feel safe and supported

Parents can foster safe peer interactions,[47] protect youth from risk patterns like victimization, bullying, and sexual harassment [53], promote emotional well-being, and lower the risk of mental illness, eating disorders, and drug use [54]

### 7.4 Provide support to their abilities

Parents' involvement in their children's lives significantly impacts their development by improving communication skills, fostering family decision-making, and enhancing autonomy and self-efficacy in professional decision-making.[46,47,55]

### 7.5 Effect on brain development.

Less favorable parenting leads to decreased brain adaptation and cognitive control activity, while positive maternal behavior predicts slower cortical thinning and reduced volumetric growth in the right amygdala [56,57].

## 8 CONCLUSION

Inconsistencies, delusions, shocks, and uncertainty in social interaction and self-discovery make adolescence a difficult time. In order to address the inquisitiveness about love, life, and relationships, parents can give them factual, age-appropriate, and scientific information on marriage, relationships, sexual abstinence, healthcare access, and counseling in a friendly environment. Instead of setting goals for their adolescents, parents should carefully listen to them, show empathy, offer clear expectations, and let them to make their own decisions and make family homes a safe haven for them under parents care. Parents must understand that each adolescent is unique, and there is no one-size-fits-all approach to parenting during this stage. Flexibility, understanding, and maintaining a strong, supportive connection can help navigate the challenges of parenting the adolescents today.
