

**Editor's Comment:**

In my opinion, the paper in its present form is not suitable for publication. Although the authors corrected the work according to the reviewers' remarks, the work, in my opinion, is not a scientific work but a research report - the results of the work are presented in tables, figures and in the so-called discussion of results. A discussion of results is a discussion of whether and how the amounts of fertiliser influence the properties and possibly an attempt to explain this influence - there is none here. What is the point of reproducing results in tables and figures if there is no discussion. In addition, data differing by a factor of a few or even a dozen in one figure should not be included - data with small values are unreadable. If the authors carry out a thorough discussion of the results the paper can, in my opinion, be published - in its present form - not.
