Influence of organic manure and bio fertilizers on the growth yield and productivity of guava under meadow orcharding

ABSTRACT:-

The study was conducted to investigate ~~the effect of~~ “Influence of organic manure and biofertilizers on the growth, yield and productivity of guava under meadow orcharding” at Horticulture Research Farm, Department of Agronomy, Naini Agricultural Institute, Sam Higginbottom University of Agriculture Technology and Sciences, Prayagraj. In this experiment, various organic sources (Farm yard manure (30 kg/plant/yr), vermicompost (30 kg/plant/yr) and neem cake (3 kg/plant/yr) along with various biofertilizer combinations (Azotobacter, Azospirillum, PSB) were tested on five-year-old guava cultivar 'Allahabad Safeda' to study its effect on growth, fruiting and yield. The results obtained showed higher fruit weight (218.00 g), fruit length (7.60 cm), fruit diameter (7.42 cm), maximum number of fruits produced per plant (26.64 fruits/plant), maximum yield per plant of 5.81 kg/plant and maximum yield per ha (23.12 t/ha) with the application of T₉. With respect to biochemical parameters, The highest total soluble solids (12°Brix) and total sugar content of fruit (8.26%) was also recorded with the application of treatment T₉. Application of nutrients through organic along with biofertilizers improve soil health in terms of mean microbial population in the rhizosphere of root zone soil as compared to control. From the present study, ~~The-the~~ application of bio fertilizers ~~also~~ and organic manures has a beneficial effect on the availability of major nutrients in the soil particularly and it also helps in maintaining the soil growth of the fruits at a desired level. It can be concluded that, for better growth, yield and quality of guava fruits, treatment T₉ (details) was

1. INTRODUCTION:-

Guava (*Psidiumguajava* L.) is the apple of the tropics and is one of the popular fruits grown in tropical, sub-tropical and some parts of arid regions of India. Guava fruit belongs to the family Myrtaceae. [Guava-It](#) is the 5th most important fruit of India based on acreage and production after mango, banana, apple and citrus. Guava has become more popular in our country due to its prolific and precocious bearing habit, and wider adaptability under various agro-climatic conditions ([Mihraet al., 2017](#)).

Guava is available at a cheap rate and is popularly known as the ‘apple of plains and poor man’s apple’. In north Indian agro-climate conditions, guava flowers twice a year-first in April-may for the rainy season crop and then, in September-October for the winter season crop. Generally, fruit yield is more in rainy season [erops as](#) compared to the winter season ([Shramaet al., 2018](#)).

Guava is the fifth most important fruit crop from the production point of view after the banana, citrus, papaya. The total area, [of](#) production and productivity of guava in India is about 0.244 million hectares, 33,18000 million tonnes, and 13.5 mt/ha, [respectively](#). It is [widely](#) grown in several parts of India but according to productivity Uttar Pradesh, Bihar and Andhra Pradesh are on the top. The popular varieties are Allahabad Safeda, Allahabad Surkha, Shweta, Sardar (Lucknow-49), Pant Prabhat [and](#)-Lalit. In Madhya Pradesh, total area and production of guava is about 7 [mt](#)Mt/ha. Madhya Pradesh ranks 1st in production of the guava. [It](#) shares about 3.5 % area of production in India. Major guava-producing districts in Madhya Pradesh are Jabalpur, Ujjain, Ratlam, Rajah, and Mandsaur. Guava fruit becomes fully ripe between 3-5 days at room temperature([Raniet al., 2021](#)).

Guava fruit of variety Locknow-49 is a selection from open pollination of Allahabad Safeda cultivar form Ganeshkhind, Pune (M.H) and is also called Sardar Guava. Trees are vigorous. The leaves are elliptical-ovate to oblong in shape. Fruits are roundish ovate in shape.

Skin colour is primrose - yellow, the pulp is whitish, very sweet and tasty with a TSS of 9.5 °B and vitamin C content 130mg/100g. It has been observed that pectin content is higher in winter season guava than the monsoon fruits (Mishra et al., 2017).

The Meadow Orchard is a modern method of fruit cultivation using small or dwarf tree with modified canopy. Better light distribution within tree canopy increases the well-number of well illuminated leaves. It also promotes rate of photosynthesis that leads to high yield per unit area. This system of guava planting is going to revolutionize the guava industry by enhancing productivity coupled with reduction in production costs. The meadow orchard system of guava accommodates 5000 plants / ha, planted at 2.0 x 1.0m spacing and managed with regular topping and hedging, especially during initial stages. Topping and hedging in guava are helpful in controlling tree size and extending fruit availability. A comparison between meadow orchard system and the traditional system of fruit growing is necessary to evaluate the potentiality of this technique.(Jamwalet al., 2018)

Meadow orchard system is a new concept of guava planting which has been developed for the first time in India at Central Institute for Subtropical Horticulture, Lucknow. The planting is done at 2.0 m (row to row) x 1.0 m (plant to plant), which gives a density of 5000 plants ha⁻¹. Initially, the trees are pruned and trained to allow maximum production of quality fruits during the first year. A single trunk tree with no interfering branches up to 30 - 40 cm from the ground level is desirable to make dwarf tree architecture. After a period of 1-2 months of planting, all the trees are topped at a uniform height of 30-40 cm from the ground level for initiation of new growth below the cut ends. No side shoot or branch should remain after topping. This is done to make a single trunk straight up to 40 cm height. After 15-20 days of topping, new shoots emerge. In general, 3 - 4 shoots are retained from below the cut point after topping. As shoots mature generally after a period of 3-4 months, they are reduced by 50 per cent of their total length so that new shoots emerge below the cut point. This is done to attain the desired tree canopy architecture and strong framework. The emerged shoots are allowed to grow for 3 - 4 months before they are again pruned by 50 per cent. After pruning, new shoots emerge on which flowering takes place. At present, guava is largely cultivated through a traditional cultural practices and systems under which it is difficult to achieve desired level of production, because large tree provides low production per unit area and needs higher labour inputs. Moreover, some times this plant does not flower and fruits for longer time, which could further

Comment [A6]: Process of meadow orcharding is not required

increases the overall cost of production. An overriding need exists either to improve the traditional system of cultivation or to develop new and modern system of cultivating guava to overcome the problems inherent with this tree. **Jamwal et al., (2021)**

2. MATERIALS AND METHODS:-

2.1 Geographical location of the experimental site

The experimental site is located at a latitude of 25.41° North and longitude of 81.84° East, with an altitude of 98 meters above the mean sea level (MSL).

2.2 Climatic conditions of the experimental area

The area of Prayagraj comes under humid sub-tropical climate, which experiences warm humid monsoon, hot dry summer and cold dry winter. The annual mean temperature is 26.1°C while monthly mean temperatures are 18-29°C. The daily average maximum temperature is about 22°C and the minimum temperature is 9°C. The average annual rainfall received is 1042.2 mm. At this location, the temperature reaches up to 46°C-48°C and the minimum temperature recorded is 4°C-5°C. The relative humidity ranges in this location between 20-94%.

2.3 Experimental details

NC – Neem Cake

3. RESULTS AND DISCUSSION

The different levels of organic manure in combination with bio fertilizers showed positive response on physical as well as chemical ~~quality~~ attributes of guava fruits. The maximum values of physical ~~quality~~ characters of guava fruits like fruit weight (218), fruit length (7.6cm), fruit diameter (7.42), fruit volume (213.86), were recorded in T9 (FYM (30kg/plant) +Azospirillum @250g/tree +PSB @250g/tree +Neem cake @3kg/tree) while, minimum values of these characters maximum value of physical parameter was recorded in control treatment (To). The maximum values of chemical ~~quality~~ attributes like titrable acidity (0.48), in treatment To and ascorbic acid content (198), T.S.S (12.0%), reducing sugar (4.24), Non reducing sugar (4.02), Total sugar (8.26). The minimum value of acidity (0.41%) was recorded in T0. While, the minimum values for these parameters of physical quality characters.

The minimum values of chemical quality attributes like ascorbic acid content (160), TSS (9.61%), reducing sugar (3.67), non reducing sugar (3.72), total sugar (7.39) and minimum value of acidity (0.47%) were recorded in T1. and highest acidity (0.41) was recorded in control treatment T9.

The maximum number of fruits per plant (26.64) was produced by the treatment T9- and- The minimum number of fruits per plant (17.26) was recorded in control To. The highest- yield per plant (5.81kg) was recorded in the treatment T9- and the lowest yield per plant (2.96kg) was recorded in control T1. The highest yield/ ha, (23.23 ton.) was recorded in the treatment T. and While, the lowest yield (11.95 ton.) was recorded in control T1.
