

Effect of chemical weed management on grain yield, yield attributes and weed dry matter of rice (*Oryza sativa*) through different pre and post emergence herbicides

Yield, yield attributes and weed biomass of rice (*Oryza sativa*L.) as influenced by weed control treatments

Formatted: Font: Not Italic

Abstract

The present investigation was conducted during the *Kharif of 2019* at Research cum Instructional Farm, Indira Gandhi Krishi Vishwavidyalaya, Raipur, Chhattisgarh. The experiment was laid out in randomized complete block design (RCBD) with three replications and ten weed management treatments viz. Pretilachlor (PE) 750 g ha⁻¹ (T₁), BispyribacNa (PoE) 25 g ha⁻¹ (T₂), Fenoxaprop-p-ethy (PoE) 156.25 g ha⁻¹ (T₃), Cyhalofop-butyl (PoE) 180 g ha⁻¹ (T₄), Penoxsulam+ Cyhalofop butyl (PoE) 135 g ha⁻¹ (T₅), Penoxsulam (PoE) 22.5 g ha⁻¹ (T₆), Metsulfuronmethyl (early PoE) 14 g ha⁻¹ (T₇), 2,4-D Ethyl Ester (PoE) 750 g ha⁻¹ (T₈), weed free (HW) (T₉), at 20, 40 and 60 days after sowing and one weedy check (T₁₀). Result was found that among the weed management treatments, the weed free treatment (T₁₀) registered significantly highest value and was at par the application of Penoxsulam+ Cyhalofop butyl 135 g ha⁻¹ (T₅), yield attributing characters, grain and straw yield and dry matter of *Alternanthera sessilis* it was found the lowest value in the application of Penoxsulam+ Cyhalofop butyl 135 g ha⁻¹ (T₅).

Comment [A1]: Is it a weed free or Hoe weeding? You have to be specific

Comment [A2]: No conclusion and recommendation

Comment [A3]: Always maintain a 1.0 line spacing in the abstract section.

Key word- Direct seeded rice, herbicides, ~~Pretilachlor, Bispyribac Na, Fenoxaprop p ethy, Cyhalofop butyl, Penoxsulam+ Cyhalofop butyl, Penoxsulam, Metsulfuronmethyl, 2,4 D Ethyl Ester.~~

Comment [A4]: These are all herbicides why listing them as key words since you enlisted herbicide already? You therefore need to add more key words.

Introduction

Rice (*Oryza sativa* L.) is a monocot type plant of the *Oryza* genus under the Poaceae family. Rice is the world's most extensively grown crop and the primary staple food of over 60 percent of the world's population. Under diversified conditions, rice occupies a major role among food crops. Approximately 90% of the world's rice is produced and consumed in Asia. The world's total rice area is 167.0 mha and production is about 769.6 mt with productivity of 4.6 t per ha however, as per estimate, about 40% of rice yield lost due to various pest, of which weeds have the most potential for loss as (32%). Because of the prevalence of congenial environment during the kharif season weeds posed a big problem in rice production. Direct seeded rice (DSR) provides a good crop establishment as well as good yield potential if adequately kept under weed free environment (Rao *et al.* 2017). On the other hand, rice yield was reduced by 35-100 per cent in direct seeded rice in the absence of proper weed control (Kumar *et al.*, 2008). In Chhattisgarh, area under direct seeded rice is increasing considerably due to availability of new seeding implements, use of pre emergence herbicide and non availability of labour during transplanting. DSR also gives higher yield with less cost of cultivation (). On the other hand, a complex weed flora present in direct seeded field which compete with rice plants severely and poses yield losses yield mainly due to the absence of impounding of water at crop emergence.

Comment [A5]: citation

Alternanthera sessilis exists as a noxious weed in both wetlands and uplands and can grow on a variety of soil types and this weeds are posing a serious threat to agro-biodiversity in several countries in the world (scouce). Its common name in Hindi is Gudrisag, Garundi and in Chhattisgarhi it is named as Resham Kanta. It is a herbaceous, weak, cylindrical, having with spreading branches from the base; yellowish-brown to light-brown in colour its nodes and internodes are distinct. Leaves are sessile, linear-oblong, or elliptic, obtuse or sub acute; no characteristic odour and taste. Flowers are small, axillary, sessile heads, white or tinged with pink colour. Fruit are utricle 1.5 mm. long, orbicular, compressed with thickened margins (source).

MATERIAL AND METHODS

Field experiment was conducted during kharif season of 2019. The experimental site was located at Research cum Instructional Farm Department of Agronomy, Indira Gandhi Agriculture University, Raipur, Chhattisgarh. The meteorological data recorded during study showed that crop received 975.4 mm rainfall during the crop period. The soil of the experimental field was sandy clay loam in texture. The soil was neutral in reaction. It had low nitrogen, medium phosphorus and high potassium contents. Rice variety Indira Rajeshwari-1 was direct seeded on 8th July 2019 in rows 20 cm apart using seed cum fertilizer drill using seed rate of 100 kg ha⁻¹. The experiment was laid out in randomized complete block design (RCBD) with three replications of ten weed management treatments viz. Pretilachlor (PE) 750 g ha⁻¹(T₁), Bispyribac Na (PoE) 25 g ha⁻¹(T₂), Fenoxaprop-p-ethyl (PoE) 156.25 g ha⁻¹(T₃), Cyhalofop-butyl (PoE) 180 g ha⁻¹(T₄), Penoxsulam+ Cyhalofop butyl (PoE) 135 g ha⁻¹(T₅), Penoxsulam (PoE) 22.5 g ha⁻¹(T₆), Metsulfuronmethyl (early PoE) 14 g ha⁻¹(T₇), 2,4-D Ethyl Ester (PoE) 750 g ha⁻¹(T₈), weed free (HW) (T₉), at 20, 40 and 60 days after sowing and one weedy check (T₁₀). The pre emergence herbicide was applied 2 days after sowing (DAS) while early and late POE was applied at 16 and 22 DAS, respectively. Apply of herbicides in the field on PE at 2 DAS, PoE at 22 DAS and early PoE at 16 DAS.

Comment [A8]: are you sure that it is the crop that received the 975.4mm of rainfall or the environment?

Comment [A9]: Provide the Ph(in paranthesis), also itemize the nutrients in parenthesis as well for N, P & K.

Results and discussion

Test weight (g)

The data ~~are~~ result revealed that the different weed management ~~treatment practiced~~ did not influence ($P > 0.05$) the test weight significantly. However, numerically the highest test weight was obtained under the weed free treatment and the lowest was recorded under metsulfuron methyl 4 g ha⁻¹ weedy check treatment. Among the herbicide treatment highest test weight was registered in the application of bispyribac sodium 25 g ha⁻¹ followed by penoxsulam 22.5 g ha⁻¹, 2,4-D ethyl ester 0.750 kg ha⁻¹ and metsulfuron methyl 4 g ha⁻¹.

Comment [A10]: You need to state the data collection aspect as well as the mode of statistical analysis done and the means of separating the significant means and at what level of significance.

Comment [A11]: I disagree with you because even numerically, the application of Bispyribac sodium 25 g ha⁻¹ PoE gave 25.22 while weed free gave 22.45 but you claim that weed free gave higher. How? Furthermore, if there was no significant difference among the treatments, there is no need for any comparison please.

4.1.2.8 Grain yield (q ha⁻¹)

~~Data~~ results pertaining to grain yield is presented in Table . It was distinct from the ~~result data~~ that the different weed management treatment significantly influenced the grain yield. Among the herbicide treatments, the highest grain yield (5.04 t ha⁻¹) was recorded under the application of penoxsulam+ cyhalofop-butyl 135 g ha⁻¹ which was ~~very closed to that of~~ closely followed by the weed free ~~treatment~~ (5.08 t ha⁻¹) compared to weedy check that yielded the lowest grain. This can be explained by less competition with weeds at critical stages of plant growth which resulted in higher number of grains bearing effective tillers compared to the unweeded plots that compete with the weeds throughout the growing season. The weedy check treatment yielded the lowest grains². These finding were in conformity with the finding of Bahar and Singh (2004) who stated the *Alternanthera sessilis* is responsible for grain yield losses of 45% in rice .The grain yield of rice decreased by 25-28% when *Alternanthera sessilis* was not controlled effectively as under herbicidal treatment T1, T2 and T3, T4 and competed with rice up to maturity (Mishra and Singh, 2008). The higher grain yield of rice and reduced weed density effectively at different growth and at harvest through application of cyhalofop-butyl 120 g ha⁻¹, closely followed by pendimethalin 1.0 kg ha⁻¹ reported by Bahar and Singh (2004) . Lowest grain yield obtained in weedy check treatment might be due to maximum growth of *Alternanthera sessilis*. *Alternanthera sessilis* was responsible for grain yield losses of 45, 19 and 20% in rice also reported by Yi (1992), Zhang *et al.* (2004). The lowest grain yield under the weedy check treatment might be due to season long weed competition exerted by the weeds at the critical stages of the crop growth which reduced the availability and uptake of nutrients and also the mutual shading by the weeds resulting in reduced photosynthesis and translocation of carbohydrate from source to sink.

Comment [A12]: It is no longer a data since it has been subjected to statistical analysis, it is now a result.

Comment [A13]: There is need for you to compute for the yield reduction due to infestation by *Alternanthera sessilis* for your experiment to justify that of Mishra and Singh, 2008.

Comment [A14]: Please provide the real treatments and T1, T2.....

Comment [A15]: You need to recast this discussion as you not aligning it with your study.

4.1.2.9 Straw yield (q ha⁻¹)

~~result Data~~ pertaining to straw yield are presented in Table 1. The ~~result data~~ show that the maximum straw yield was obtained under weed free treatment. Among the herbicide treatments, the highest straw yield recorded under the application of penoxsulam+ cyhalofop-butyl 135 g ha⁻¹ followed by penoxsulam 22.5 g ha⁻¹, bispyribac Na 25 g ha⁻¹ and metsulfuron methyl 4 g ha⁻¹, which were at par with the weed free treatment compared to the weedy check hat recorded the lowest yield. The lowest lowest yield was observed under the weedy check

~~treatment?~~ This finding were in confirmatory with the finding of Raj and Syriac (2016) who stated or reported that.....

4.1.2.8.10 Harvest index (%)

The ~~result of data with reference to~~ harvest index is presented in Table 1. The data clarified that the herbicide treatments did not influence the harvest index significantly. ~~However the highest harvest index was recorded under the weed free treatment and lowest was under the weedy check treatment. Among the herbicide treatments the highest harvest index registered under the application of penoxsulam+ cyhalofop butyl 135 g ha⁻¹ followed by penoxsulam 22.5 g ha⁻¹, bispyribac Na 25 g ha⁻¹, 2,4 D ethyl ester 0.750 kg ha⁻¹ and metsulfuron methyl 4 g ha⁻¹; were at par with the weed free treatment.~~

Comment [A16]: No need of this since there is no significant difference recorded.

4.1.2.11 Weed index (%)

Data with regards to weed index (WI) ~~is areshownpresented~~ in Table 1. The weed index represent the percent reduction in grain yield due to weed competition. Among all the treatment, the weedy check treatment, showed the highest weed index,

representing the highest reduction in yield due to weed competition. Among the herbicide treatment, the lowest weed index was recorded under the application of penoxsulam+ cyhalofop butyl 135 g ha⁻¹ (F5), followed by penoxsulam 22.5 g ha⁻¹, bispyribac Na 25 g ha⁻¹ and metsulfuron methyl 4 g ha⁻¹. Application of penoxsulam producing higher grain yield and the lowest weed index resulting in great increase in yield over unweeded control.

Comment [A17]: You need to discuss further and back it up with a scientific literatures

Table 1: Yield and yield attributing characters as influenced by different herbicide treatment in direct seeded rice-

Treatment	Yield attributing characters				Weed index (%)
	Test weight (g)	Grain yield (t ha ⁻¹)	Straw yield (t ha ⁻¹)	Harvest index (%)	

Comment [A18]: What do you mean by test weight? Is it the fresh or dry weight of samples?

4.2.3 Dryweight of weeds (g m⁻²)

4.2.3.1 Dry weight of *Alternanthera sessilis* (g m⁻²)

[Data results](#) regarding the dry matter of *Alternanthera sessilis* at different intervals of crop growth are presented in Table 2 ,3 and 4. At all the growth stages, among all the treatments, the highest dry matter of *Alternanthera sessilis* was recorded under the weedy check treatment and the lowest dry matter was recorded under the weed freeplot. At 30 DAS, very less dry matter of weed was observed in the weed free treatment are presented in Table 2. Among the herbicides treatments, lowest dry matter of *Altenantherasessilis* was observed under the application of 2, D ethyl ester 750 g ha⁻¹ (2.62) .The highest dry matter of *Alternanthera sessilis* was recorded under the application of fenoxaprop-p-ethyl 56.25 g ha⁻¹ (22.60).

4.2.3.2 Dryweight of *Echinochloacolona* (g m⁻²)

Dry matter of *Echinochloacolona* at different intervals of crop growth are presented in Table2 ,3 and 4. At all the growth stages, among all the treatments, the highest dry matter of *Echinochloacolona* was recorded under the weedy check treatment and the lowest dry matter was recorded under the weed free plot. At 30 DAS, very less dry matter of weed was observed under the weed free as [reshown in presented](#) in Table 2. Among the herbicides treatments, lowest dry matter of *Echinochloacolona* was observed under the application of fenoxaprop-p-ethyl

56.25 g ha⁻¹(0.91). The highest dry matter of *Echinochloa colona* was recorded under the application of 2,4-D ethyl ester 750 g ha⁻¹ (2.12) as it did not controlled the *Echinochloa colona*. At 60 and at harvest among the herbicide treatments, the lowest dry matter of *Echinochloa colona* was observed (Table 3) under the application of penoxsulam + cyhalofop-butyl 135 g ha⁻¹ (2.17) closely followed by bispyribac Na 25 g ha⁻¹ (Table 3).

4.2.3.3 Dryweight of *Cyprus iria* (g m⁻¹)

Dry matter of *Cyprus iria* at different intervals of crop growth are presented in Table 2, 3 and 4. At all the growth stages, among all the treatments, the highest dry matter of *Cyprus iria* was recorded under the weedy check treatment and the lowest dry matter was recorded under the weed free plot. At 30 DAS, very lowest dry matter of weed was observed under the weed free are presented in Table 2. Among the herbicides treatments, lowest dry matter of *Cyprus iria* was observed under the application of fenoxaprop-p-ethyl 56.25 g ha⁻¹ (0.71). The highest dry matter of *Cyprus iria* was recorded under the application of 2,4-D ethyl ester 750 g ha⁻¹ (1.35). At 60 DAS and at harvest among the herbicide treatments, the lowest dry matter of *Cyprus iria* was observed (Table 3) under the application of penoxsulam + cyhalofop-butyl 135 g ha⁻¹ (0.82). The cyhalofop-butyl 80 g ha⁻¹ (6.94) treatment recorded the highest dry matter (Table 3). At harvest, The weed free treatment recorded very less dry matter of the species under discussion. Among the herbicide treatments, the lowest dry matter of *Cyprus iria* was observed under the application of penoxsulam + cyhalofop-butyl 135 g ha⁻¹ (2.45). The highest dry weight recorded under 2,4-D ethyl ester 750 g ha⁻¹ (5.88).

4.2.3.4 Dryweight of other weed (g m⁻¹)

Dry matter of other weed species at different intervals of crop growth are presented in Table 2, 3 and 4. At all the growth stages, among all the treatments, the highest dry matter of other weed was recorded under the weedy check treatment and the lowest dry matter was recorded under the weed free plot. Among the herbicides treatments, lowest dry matter of other weed was observed under the application of penoxsulam + cyhalofop-butyl 135 g ha⁻¹ (0.35). The highest dry matter of other weed was recorded under the application of 2,4-D ethyl ester 750 g ha⁻¹ (1.89) as it did not control the other weed 30 DAS. At 60 DAS and at harvest, among the herbicide treatments, the lowest dry matter of other weed was observed (Table 3) under the application of penoxsulam + cyhalofop-butyl 135 g ha⁻¹ (1.01 and 1.36). The highest dry matter of other weed was recorded under the application of 2,4-D ethyl ester 750 g ha⁻¹ (2.40 and 7.16 g m⁻²) treatment recorded the

Formatted: Not Superscript/ Subscript

Formatted: Not Superscript/ Subscript

highest dry matter during all the bothgrowth stages (Table 3).At harvest, all the treatments observed (Table 4.)with reduction in dry matter of . The weed free treatment recorded very less dry matter of the species under discussion. Among the herbicide treatments, the lowest dry matter of other weed observed under the application ofpenoxsulam + cyhalofop-butyl 135 g ha⁻¹ (1.36) .The highest dry matter of other weed was recorded under the application of 2, D ethyl ester 750 g ha⁻¹ (2.77).

4.2.3.5Dry weight of total weed (g m⁻¹)

Totalweed dry matter of other weed species recorded at different time intervals are presented in Table 2 ,3 and 4.At all the growth stages, among all the treatments, the highest dry matter of total weeds was recorded under the weedy check treatment and lowest was observed under the weed free treatment.At 30, 60 DAS and at harvest among the herbicides treatments, the lowest dry matter of total weed was observed (Table 2) under the application of metsulfuron methyl 4 g ha⁻¹ (16.75) followed bypenoxsulam + cyhalofop-butyl 135 g ha⁻¹ and penoxsulam 22 g ha⁻¹ . The highest was dry matter of total weed measured under the application cyhalofop- butyl 80 g ha⁻¹ .At 60 DAS, the weed free treatment recorded lowest weed dry matter. While among the herbicide treatment the lowest dry matter of total weed was observed (Table 3) under the application ofpenoxsulam + cyhalofop-butyl 135 g ha⁻¹ followed by bispyribac Na 25 g ha⁻¹ and the highest was dry matter of total weed measured under the application cyhalofop- butyl 80 g ha⁻¹ . At harvest the weed free treatment recorded again lowest weed matter. Among the herbicide treatment the lowest dry matter of total weed was observed (Table 4.) under the application ofpenoxsulam + cyhalofop-butyl 135 g ha⁻¹ , followed by penoxsulam 22 g ha⁻¹ and the highest was found under the application of cyhalofop –butyl 80 g ha⁻¹ as pre emergence effectively in reducing weed dry matter and increasing grain yield..

Comment [A19]: No discussion at all only result. There is need to state the significance of your findings and justify it with existing literatures.

	(4.92)	(0.86)	(1.86)	(0.28)	(7.92)

Comment [A20]: You need to state their unit either in grams or kilograms.

Weedy check	9.81 (95.77)	2.50 (5.74)	2.54 (5.95)	3.58 (8.31)	10.78 (115.77)
SEm±	0.21	0.27	0.18	0.41	0.31
LSD (P= 0.05)	0.65	0.81	0.54	1.24	0.94

*DAS: Days after sowing; Figures in parentheses are original values, data were transformed to values $\sqrt{(x+1)}$ are in bold letters.

4.4.1 Weed control efficiency (%)

Weed control efficiency (WCE) computed at 30, 60 and at harvest and are presented in Table 5. It was evident from the [result data](#) that at all the growth stages, the highest weed control efficiency was recorded under the weed free treatment due to season long weed free condition. Among the herbicides, at 30 DAS, the highest weed control efficiency was [computed obtained](#) under the application of metsulfuron methyl 4 g ha⁻¹ (64.09 %) followed by penoxsulam + cyhalofop-butyl 35 g ha⁻¹ (63.24 %) 2,4-D ethyl ester 750 g ha⁻¹ (56.89%) penoxsulam 22 g ha⁻¹ (53.57%). [While Among herbicide treatments,](#) the lowest weed control efficiency was recorded under the application of cyhalofop-butyl 80 g ha⁻¹ (40.49).

At 60 DAS the highest weed control efficiency was [computed obtained](#) under the application of penoxsulam + cyhalofop-butyl 135 g ha⁻¹ (63.24) [. Among herbicide treatments, as compared with](#) the lowest weed control efficiency [was](#) recorded under the application of cyhalofop-butyl 80 g ha⁻¹ (27.36).

At harvest, the highest weed control efficiency was [computed recorded](#) under the application of penoxsulam + cyhalofop-butyl 135 g ha⁻¹ (68.98). While, [control efficiency was the lowest was](#) recorded under the application of cyhalofop-butyl 80 g ha⁻¹ (29.16) .

[This m](#)ight be due to lower percentage reduction in weed density and biomass.

The highest weed control efficiency was recorded under the application of penoxsulam + cyhalofop-butyl 0.135 kg ha⁻¹ was due to the pre-mix application of such suitable herbicides which performed better against diverse weed flora as compared to alone application of herbicide.

Table 5: Weed control efficiency (WCE) at different periods of plant growth stages as influenced by different herbicide treatments in direct seeded rice

Treatment	Weed control efficiency (%)
-----------	-----------------------------

	30 DAS	60 DAS	At harvest
Pretilachlor 750 g ha ⁻¹ PE	52.93	31.96	43.73
Bispyribac sodium 25 g ha ⁻¹ PoE	48.12	60.68	59.11
Fenoxaprop-p-ethyl 56.25 g ha ⁻¹ PoE	43.30	35.06	40.57
Cyhalofop Butyl 80 g ha ⁻¹ PoE	40.49	27.36	29.16
Penoxsulam + Cyhalofop 135 g ha ⁻¹ PoE	63.24	69.52	68.98
Penoxsulam 22 g ha ⁻¹ PoE	53.57	58.20	62.91
Metsulfuron methyl 4 g ha ⁻¹ PoE	64.09	47.38	47.70
2,4-D Ethyl Ester 750 g ha ⁻¹ PoE	56.89	54.78	54.83
Weed free	92.41	97.88	97.31
Weed check	0	0	0
SEm±	0.19	0.25	0.52
LSD (P= 0.05)	0.55	0.74	1.5

Conclusion and Recommendation

Comment [A21]: There is need for you to draw a conclusion of your result stating your finding and its implication.
