

Editor's Comment:

In the manuscript, the authors studied the healing activity of two fats from the southern regions of Senegal (Casamance).

The purpose and objectives of the study have been fully accomplished.

The studies were conducted at a high scientific and methodological level.

The authors used modern equipment and research methods.

The obtained material has been statistically processed.

The authors do not allow the use of literary data without citing it.

The conclusion is consistent with the results obtained.

However, the following comments can be made.

1. Introduction. There is no purpose of the study.

2. Materials and methods of research. Provide information on the period of obtaining and collecting honey. Also the type of honey.

3. Materials and methods

Conclusion. There are no specific results of the study. The results should be described and assessed.

Correction of comments will improve the quality of the manuscript and interest in it among readers.

I recommend revising the manuscript.
