

Editor's Comment:

As an Editorial Board Member, I would recommend rejecting the manuscript for the following reasons:

1. Insufficient Literature Reviews:

- The manuscript lacks comprehensive literature reviews to support themes such as the nutritional value of millets and their resilience to environmental stresses.
- Without robust citations and analysis of existing research, the validity of the manuscript's claims is questionable.

2. Lack of Evidence-Based Analysis:

- Claims regarding the nutritional value and sustainability of millets are not adequately supported by empirical evidence or references to peer-reviewed studies.
- A stronger reliance on evidence-based analysis would enhance the credibility of the manuscript.

3. Recommendation for Revision:

- The author is encouraged to revise the manuscript by incorporating comprehensive literature reviews and evidence-based analysis to support their arguments.
- Consulting with experts in the field may also help strengthen the research findings and interpretations.

While the manuscript has potential, it requires substantial revisions to meet the standards of our journal. I suggest the author revises and resubmits the manuscript after addressing these concerns.
